

# Protiva<sup>™</sup> PIV card v1.55 on TOP DL v2

# **Security Policy**

# (1SUB Maintenance on RnG and associated services)

TITLE	Protiva™ PIV card v1.55 on TOP DL v2 - Security Policy
Ref.	SP02R20033G - 13
DATE:	November 28 <sup>th</sup> , 2016
AUTHOR	Carlos Romero-Liceras, Gemalto
Approved	Frederic Garnier, Gemalto

# **REVISION HISTORY**

Release (Xyy)	Date ( <i>dd/ mm/ yy</i> )	Author	Modifications
01	08/11/10	F.Defrance	Initial issue.
02	15/11/10	F.Defrance	Take into account Frederic Garnier remarks
03	16/11/10	F.Defrance	Take into account Michel Escalant remarks
04	18/11/10	F.Defrance	Update hardware version
05	13/06/11	J. A. McLaughlin	Updated to PIV v1.55 applet
06	14/07/11	J. A. McLaughlin	Appendix B: Clarified PIV v1.55 applet
07	24/11/11	F.Defrance	Updated hardware version [A1023378 was chip reference and not the module one]
08	30/12/11	F.Defrance	Take into account CMVP remarks
09	10/02/12	F.Garnier	Update with CMVP comments: card terminated, keys zeroisation for ISD & PIV.
10	23/02/12	F.Garnier	Add statement: re-use existing Cert. #1450
11	06/04/2016	C.Romero-Liceras	1SUB maintenance on RnG deprecation and Associated services
12	14/04/16	F.Garnier	Update the list of services using RNG for 1SUB notifications.
13	28/11/16	F.Garnier	Corrected HW version in Appendix B

# 1 Scope

This Security Policy specifies the security rules under which the **Protiva™ PIV Card v1.55** on **TOP DL v2** Gemalto Smart Card must operate. Some of these rules are derived from the security requirements of **FIPS140-2' standard [1]**, others are derived from the Gemalto experience in embedded security software.

These rules define the interrelationships between the:

- Module users and administrators,
- Module services,
- Critical Security Parameters.

The commercial name of the product is:

#### Protiva<sup>™</sup> PIV Card v1.55 on TOP DL v2 Card

Where:

- Protiva<sup>™</sup> PIV Card v1.55 on TOP DL v2 Card is a product including:
  - Java platform available in one memory configuration: the Dual Large (DL) 128K configuration. The platform may also be referred as "TOP DL V2" in this document.
  - **Protiva™ PIV Applet v1.55** loaded on the Java Card platform "TOP DL V2". This applet may also be referred as "PIV Applet" in this document.

# 2 Introduction

#### 2.1 GEMALTO Smart Card Overview

GEMALTO aims to provide **FIPS140-2 Level 2** cryptographic smart cards. Together, the card and applets provide authentication, encryption, and digital signature cryptographic services. The present document is dedicated and focused on the security policy for the CM in its entirety, specifying the security rules under which all elements within the scope of the CM operate.

## 2.2 Gemalto Smart Card Open Platform

The cryptographic module is a state of the art Java Open Platform-based smart card. This highly secure platform benefits from all the GEMALTO expertise in Java Card security, from the latest developments in cryptographic resistance against known attacks, and provides FIPS approved cryptographic algorithms and self-tests. Additional software countermeasures have also been added by GEMALTO.

This cryptographic module uses a state of the art manufacturing flow in terms of security and provides applets with memory, cryptographic and I/O services.

The PIV Applet doesn't implement any cryptographic services. But when needed this applet use cryptographic services provided by the card platform. The cryptographic module ensures on-card applets safe coexistence thanks to its Virtual Machine (VM) and firewall. The Java VM is fully compliant with the **Java Card standard [7]**.

The card life cycle is managed according to the **Global Platform (GP) specification**. Issued cards have been loaded with applet, cryptographic keys, and a PIN, and are moreover in the "SECURED" state. The security implementation is fully compliant with the **Global Platform (GP) specification [4][12]**. The cryptographic module integrates symmetric and asymmetric cryptographic algorithms as specified in the **Java Card specification [5]** and platform offers RSA & ECDSA for Signature/Verification, SHA-1, SHA-256, SHA-384, SHA-512 hashing functions, on-board RSA Key generation, on-board ECC key generation, Triple-DES CBC and ECB , AES ECB and CBC and CMAC algorithms.

# 2.3 Security Level

The cryptographic module meets the overall requirements applicable to **FIPS140-2 Level 2**. The individual security requirements meet the level specifications as follows.

Security Requirements Section	Security Level
Cryptographic Module Specification	2
Cryptographic Module Ports and Interfaces	2
Roles, Services and Authentication	3
Finite State Model	2
Physical Security	3
Operational Environment	N/A
Cryptographic Key Management	2
EMI/EMC	3
Self-Tests	2
Design Assurance	3
Mitigation of Other Attacks	2

Table 1 – FIPS 140-2 Security Levels

# gemalto<sup>×</sup>

# 3 Cryptographic Module Specification

#### 3.1 Gemalto Crypto-Module Cryptographic Boundary

The Cryptographic Boundary is defined to be the 'ICC module edge' of the **CM**, comprising a set of "embedded" hardware and software that implements cryptographic functions and processes, including cryptographic algorithms and key generation and applications services. The FIPS 140-2 embodiment of the **CM** is single chip. The micro-module is designed to be embedded in a plastic card body to provide an **ISO-7816** [9] compliant smart card.

The Cryptographic Module provides dual interfaces (i.e. contact and contact-less) where the same security level is achieved.

#### Protiva™ PIV v1.55 on TOP DL v2 Card identification:

The Protiva™ PIV v1.55 on TOP DL v2 is based on SLE66CLX1280PE(M) chip from Infineon .

The hardware and firmware versions: see in §16-Appendix B – Identification and FIPS mode.

The TOP DL v2 Cryptographic Module has already achieved FIPS 140-2 Level 3 validation. NIST Certificate #1450 provides detail information on the FIPS validation: <u>http://csrc.nist.gov/groups/STM/cmvp/documents/140-1/140val-all.htm#1450</u>

Depending on the market and the end-customer requirements, PK support (i.e. PK enabled or PK disabled) and Secure Channel Protocol can be configured during the manufacturing in order to answer as precisely possible to the market and the end-customer requirements:

- **CONFIGURATION 1**: The product is initialized in dual interface mode; it means that both contact and contact-less mode are operated, with FIPS PK self-tests and PK services enabled. The secure channel protocol is based on AES keys : GP-SCP03-00 (option i=00 as per GP specification [12])...
- CONFIGURATION 2: The product is initialized in dual interface mode; it means that both contact and contact-less mode are operated, with FIPS PK self-tests and PK services enabled. The secure channel protocol is based on AES keys : GP-SCP03-10 (option i=10 as per GP specification [12])
   CONFIGURATION 3: The product is initialized in dual interface mode; it means that both contact and contact-less mode are operated, with FIPS PK self-tests and PK services enabled. The secure channel protocol is based on Triple-DES : GP-SCP01

The following table gives an overview of those 3 different configurations regarding SCP (Secure Channel Protocol) support.

	SCP (Secure Channel Protocol)
CONFIGURATION 1	SCP03-00
CONFIGURATION 2	SCP03-10
CONFIGURATION 3	SCP01
CONFIGURATION 3	SCP01

Table 2 – SCP support configurations

During the Gemalto manufacturing process, the chip (ICC) is wire-bonded on the inner side of a contact plate, then globe-topped with resin. The resulting Micro-Module meets the physical security requirements of FIPS140-2 Level 3.

The contact-less antenna is not within the cryptographic boundaries of the module. All the components of the **TOP DL V2 – Micro-Module** that are included in the cryptographic module boundaries, are those as shown in the following figure:

#### Figure 1- Cryptographic Module Boundary

The following sections provide a description of the different entities presented in this scheme.

#### 3.2 Language level

The scope of this security policy is focused both on the Java Card Platform and on the PIV Applet (in EEPROM). The cryptographic module is implemented using a high level language, a limited number of software modules that require fast processing have been written in a low-level language. The application code "Applet" is designed in the Java Card language that is a high level language. The applet code complies with the Java card code verifier to ensure compliance with language rules.

# 3.3 FIPS Approved Security Functions

The following table gives the list of FIPS approved security functions that are provided by the Protiva<sup>™</sup> PIV v1.55 on TOP DL v2 Card Java Card API.

SECURITY FUNCTION	DETAILS	FIPS APPROVED
	3-key ECB mode in encryption	
Triple DES	2-key and 3-key ECB mode in decryption	Cert. # 938
Triple-DES	3-key CBC mode in encryption	
	2-key and 3-key CBC mode in decryption	
Triple-DES MAC	3-key ECB and CBC modes for generation	Cert. # 938
TTIPIE-DES MAC	2-key and 3-key ECB and CBC modes for verification	Vendor Affirmed
SHA-1, SHA-256, SHA- 384, SHA-512	Hashing operation	Cert. #1243
ECDSA	Signature Verification following X9.62 with SHA-1 hashing (P-192, P-224, P-256, P-384, P-521)	Cert. #172
	SigGen Component: P-224, P-256, P-384, P-521, K-233, K- 283, K-409, K-571, B-233, B-283, B-409, B-571	CVL Cert. #224
RSA	Verification following PKCS#1with SHA-1 hashing	Cert. # 664
RSASP1 Signature Primitive		CVL Cert. #217
AES	ECB mode in encryption	
	ECB mode in decryption	Cert. #1363
	CBC mode in encryption	
	CBC mode in decryption	

#### Table 3 – FIPS Approved Security Functions

Additional cryptographic algorithms:

The following algorithms are part of the JavaCard 3.0.1 specification:

SECURITY FUNCTION	DETAILS	FIPS APPROVED
ECDSA	Signature Verification following X9.62 with SHA-256 / SHA- 384 / SHA-512 hashing (P-192, P-224, P-256, P-384, P-521)	Cert. #172

#### Table 4 – Additional Security Functions

The functions in Table 5 are Now Disallowed and cannot be used in the Approved mode.

FUNCTION	DETAILS	
Triple DES	2-key ECB mode in encryption (*)	
Triple-DES	2-key CBC mode in encryption (*)	
Triple-DES MAC	2-key ECB and CBC modes for generation (*)	
Key generation following X9.31 (*)		
Signature following PKCS#1 with SHA-1 hashing (*)		
PRNG	Pseudo Random Number Generation (*)	

FUNCTION	DETAILS
ECDSA	Signature Generation (*) following X9.62 with SHA-1 / SHA-256 / SHA-384 / SHA-512 hashing (P-192, P-224, P-256, P-384, P-521)
	Key pair generation (*) following X9.62

Table 5 – Non-Approved Functions (Disallowed per NIST SP 800-131A Transitions)

Note (\*): Services/CSPs using disallowed functions are not allowed in the Approved mode.

# 4 Cryptographic Module Ports and Interfaces

The **CM** restricts all information flow and physical access. Physical and logical interfaces define all entry and exit points to and from the micro module. The CM is intended to be used with ISO 7816 contact and ISO 14443 contactless readers external to the cryptographic boundary.

#### 4.1 Physical Port – Contact mode

4.1.1 PIN assignments and contact dimensions:

Protiva<sup>™</sup> PIV v1.55 on TOP DL v2 Card – Micro-Module follows the standards "ISO 7816-1 Physical characteristics" [9] and "ISO 7816-2 Dimensions and contact location" [9].

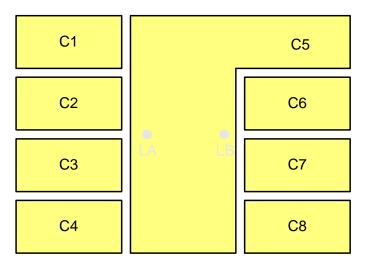

Figure 2 - Contact plate example – Contact physical interface

Contact No.	Assignments	Contact No.	Assignments
C1	VCC (Supply voltage)	C5	GND (Ground)
C2	RST (Reset signal)	C6	Not connected
C3	CLK (Clock signal)	C7	I/O (Data Input/Output)
C4	Not connected	C8	Not connected

Table 6 - Contact plate pin list – Contact mode

#### 4.1.2 Conditions of use

The electrical signals and transmission protocols follow the **ISO 7816-3 [9]**.

Conditions	Range
Voltage	1,62 V and 5.5 V
Frequency	1 MHz to 7,5 MHz

Table 7 - Voltage and frequency ranges

#### 4.2 Physical Port – Contact-less mode

#### 4.2.1 Contacts assignments

In the contactless mode the **CM** follows the standard **"ISO 14443 RF Interface"** [11] and only uses two connections that are physically different and distinct from the connections used in the contact mode. Those electrical connections, LA and LB, are placed on the module backside and are used to connect an external **antenna loop that is not within the cryptographic boundaries of the module**.

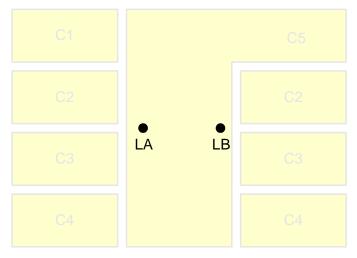

Figure 3 - Contact plate example - Contact-less antenna contacts

Contact No.	Assignments	Contact No.	Assignments
LA	Antenna coil connection	LB	Antenna coil connection

Table 8- Contact plate pin list – Contact-less mode

#### 4.2.2 Condition of uses

The radiofrequencies and transmission protocols follow the "ISO 14443 RF Interface" [11].

Conditions	Range
Supported bitrate	106 Kbits/s, 212 Kbits/s, 424 Kbits/s and 848 Kbits/s
Frequency	13.56 MHz

Table 9 - Voltage and frequency ranges

#### 4.2.3 Picture – Dual Mode

#### Thermal black resin process, contact and contactless technology

Figure 4 - CM Physical Encapsulation and External Connections

## 4.3 Logical Interface

The **TOP DL V2** platform provides services to both external devices and internal applets as the PIV and Card Manager applets.

External devices have access to services by sending APDU commands while internal applets such as the PIV Applet has access to services through internal API entry points.

The CM provides an execution **sandbox for the PIV Applet** and performs the requested services according to its roles and services security policy.

For security reasons, the CM inhibits all data output via the data output interface when an error state is reached and during self-tests.

# 5 Roles, Services and Authentication

This section specifies the roles, security rules, services, and CSPs of the CM. The Identification and Authentication Policy, and the Access Control Policy define the interrelationships between roles, identities, through the services and security rules.

The services that are provided by the CM are listed in the subsection labeled "SERVICES" in the Access Control Policy description.

## 5.1 Identification and Authentication Policy

#### 5.1.1 Introduction

This section is dedicated to our identity-based authentication policy, and the related security rules of the mechanism interfaces and SRDI.

#### 5.1.2 Identity based authentication policy

In order to describe our authentication policy we introduce the following diagram. It shows the links between the different roles, and helps rationalization of a complete trust chain. Both off-card and on-card entities are represented.

The following table describes the two roles associated to the Cryptographic Module:

The module performs identity-based authentication using PIN and cryptographic keys. A unique index value is associated with the PIN or the cryptographic key to uniquely identify the off-card entity performing the authentication. The following table describes the roles associated to the CM:

FIPS Role Type	Role ID	Description	
Crypto Officer	со	The Cryptographic Officer (CO) role is responsible for managing the security configuration of the card manager and security domains. The CO role authenticates to the CM by demonstrating to the Card Manager or PIV application knowledge of a GP secure channel TRIPLE-DES key set stored within the Card Manager. By successfully executing the GP secure channel mutual authentication protocol, the CO role establishes a secure channel to the Card Manager and executes services allowed to the CO role in a secure manner.	
Crypto Officer	САА	The PIV Card Application Administrator (CAA) role represents an external application requesting the services offered by the PIV Applet. An applet authenticates the Application Operator role by verifying possession of the Application External Authenticate (XAUT) TRIPLE-DES key	
User	СН	The Card Holder (CH) role is responsible for ensuring the ownership of his CM, and for not communicating his PIN to other parties. The PIV Applet authenticates the Card Holder by verifying the PIN value.	
User	СНП	The Card Holder II (CHII) role is responsible for unblocking and/or changing the Card Holder PIN. The PIV authenticates the Card Holder II by verifying the PIN value.	
Unauthenticated	AU	Anonymous User – the unauthenticated "role"	

#### Table 10 - Role profile definitions

The CM does not implement a maintenance mode or role.

#### 5.1.3 Mechanism interfaces

The following tables describe the mechanisms for authentication of the roles:

Interface	Description
INITIALIZE UPDATE (*) APDU	
	This APDU command initiates the setting up of a secure channel. The card generates the session keys and exchanges data with the host.
EXTERNAL AUTHENTICATE (	*)
APDU	
	This APDU command is used by the card to authenticate the host and to determine the level of security required for all subsequent commands. A previous and successful execution of the INITIALIZE UPDATE command is necessary prior to processing this command.

Interface	Description
GENERAL AUTHENTICATE (*	)
APDU	
	The APDU command is used to perform a cryptographic operation such as an authentication protocol using the data provided in the data field of the command and returns the result of the cryptographic operation in the response data field. The GENERAL AUTHENTICATE command shall be used to authenticate the card or a card application to the client application (INTERNAL AUTHENTICATE), to authenticate an entity to the card (EXTERNAL AUTHENTICATE), and to perform a mutual authentication between the card and an entity external to the card (MUTUAL AUTHENTICATE). The GENERAL AUTHENTICATE command shall be used to realize the signing functionality on the PIV client-application programming interface.
VERIFY	
APDU	
	This APDU command initiates the comparison in the card of the reference data with data field of the command. The referenced PIN must be successfully verified

Table 12 - Mechanism interfaces in applicative phase

# 5.1.4 Security rules

The following table presents the security rules applied to these mechanisms:

Rule Identifier	Description	
ia_pin_rule.1	It is not possible to get authenticated through the PIN authentication mechanism if the authorized number of attempts is reached.	
ia_pin_rule.2	It is not possible to get authenticated through the PIN authentication mechanism if the referenced PIN is not found	
ia_pin_rule.3	It is not possible to get authenticated through the PIN authentication mechanism if the submitted PIN is incorrect	
ia_pin_rule.4	The pin must be re-authenticated if the card is reset	
ia_pin_rule.5	The pin must be re-authenticated if a new application is selected on the same channel	
ia_pin_rule.6	The pin remains active if another application is selected on another channel	
ia_pin_rule.7	The PIN length must be 8 characters.	
ia_co_rule.1	The Cryptographic Officer must be re-authenticated if the card is reset.	
ia_co_rule.2	The Cryptographic Officer must be re-authenticated if the CM detects a secure messaging corruption.	
ia_co_rule.3	The Cryptographic Officer cannot get authenticated if the authorized number of attempts is reached.	

Table 13 - Security rules

## 5.1.5 Mechanism strengths

Authentication Mechanism	Strength of Mechanism
	The strength of the mechanism used for GP authentication depends on the Secure Channel Protocol: SCP01 or SCP03.
	For Configuration 1 and 2 (SCP03), the strength of GP mutual authentication relies on AES key length:
	$-\left(\frac{1}{2^{256}}\right)$ for AES 32-byte-long keys (default);
GP mutual authentication (*)	$-\left(\frac{1}{2^{128}}\right)$ for AES 16-byte-long keys;
	For Configuration 3 (SCP01), the strength of GP mutual authentication:
	$\left(\frac{1}{2^{80}}\right)$
	The cryptogram sent is 8 bytes long and Triple-DES 2keys is used. Strength is as described in SP 800-57
	$\left(\frac{1}{256^8}\right)$
PIN verification	Pin verification is the responsibility of the PIV Applet that defines and maintains its own security policy regarding PIN but uses the PIN management services provided by the platform.
	1/2 <sup>112</sup>
CAA authentication (*)	CAA authentication is the responsibility of the PIV Applet using External Authenticate option of the GENERAL AUTHENTICATE command that involves verifying decryption of an 8-byte challenge using the secret 3-Key Triple-DES key. Strength for 3-Key Triple-DES is as described in SP 800-57.

Note: All authentication mechanisms above have a less than 1 in 1,000,000 random attempt success rate

## 5.2 Access Control Policy

#### 5.2.1 Introduction

This chapter is dedicated to access control security rules. Some services provided by the CM are subject to privileges. Privileges can be obtained by construction (for example at applet initialization) or by being identified as a privileged user.

List of the security related process or mechanisms specified for the PIV Applet during the applicative life cycle:

• Secure messaging: It is possible to open a secure channel during the personalization phase of the applet (between the personalization device and the card, when the applet is in the SELECTABLE

state) by using the security domain of the java platform. Opening of this secure channel is necessary to perform the initial personalization (pre-personalization) of the PIV Applet. Once this initial PIV Applet pre-personalization is completed, the applet is in Application mode. In Application mode opening of a secure channel is optional. A secure channel may be part of access conditions to a particular object in which case it becomes necessary to access that object.

• Access Conditions: Each object stored in the card embeds its own access conditions. These conditions defines the minimum security required to access to the object. As the access to the object is done through a command, a security condition is defined for each command accessing the object.

An Access Rule is encoded with an Access Mode byte, followed by one or more Security Condition bytes. The PIV Data objects Access management rules:

- Free (always): No access condition.
- Never: No execution possible.
- **PIN**: The referenced PIN must be successfully verified. This flag is set until an incorrect PIN verification or an application selection or a reset.
- **PIN Always**: The referenced PIN must be successfully verified by the previous command.
- Authentication: The external authentication (using general authenticate command) must have been successfully performed with the referenced key. The authentication flag is set until a new successful authentication, an application selection or a reset.
- Secure Channel (SM): A Secure Channel in MAC+ Encrypt mode must be opened.

#### Secure Messaging During Personalization phase :

- The Card Manager through the API used by PIV personalization provides the secure messaging. In a GP 2.1.1 card, the secure messaging is initiated after a mutual authentication. It means that INITIALIZE UPDATE and EXTERNAL AUTHENTICATE commands have been successfully executed. The secure channel can have the four following modes:
  - Mutual Authentication required before attempting any command: **AUTHENTICATION**.

- All commands require a previous Mutual authentication and must be sent with Integrity (and/or Authentication): **Mac** mode.

- All commands require a previous Mutual authentication and must be in **Mac & ENCRYPTION** mode.
- When in application mode only supports MAC & Encrypted mode is possible.

#### 5.2.2 Services

The access control rules are applied to all of the following services. (The services have been grouped according to the role to which they provide a service.)

#### When the Card Manager applet is selected the following commands are available:

Interface S	Service Description
	<i>u</i> This APDU is used to delete a uniquely identifiable object such as an Executable Load File, an application, optionally an Executable Load File and its related Applications.
T	<b>THENTICATE</b> (*) – <i>APDU</i> This APDU command is used by the card to authenticate the host and to determine the level of accurity required for all subsequent commands. A previous and successful execution of the <b>NITIALIZE UPDATE</b> command is necessary prior to processing this command.
<b>GET DATA</b> – A/ T	PDU This APDU command is used to retrieve a single data object.
li	APDU This APDU command is used to retrieve the Card Manager, load file (package), and application ife cycle data specific to the GP specification. PDATE (*) – APDU
Т	This APDU command initiates the setting up of a secure channel. The card generates the session keys and exchanges data with the host.
	<i>DU</i> his APDU command informs the card of the various steps required to load, install and make an pplet selectable within the card.
LOAD – APDU O	ne or more LOAD commands are used to load the bytecode of the load file (package) defined in the previously issued INSTALL command to the card.
MANAGE CHAI	
	<i>PDU</i> his APDU command is used to set the value of the various data elements utilized and managed y the Card Manager (deprecated OP command)
PUT KEY (*) – T 1 2 3 K	
<b>SELECT</b> – APDU T	U his APDU command is used for selecting an application.
C) F(	APDU his APDU command is used to change the state of the Card Manager (ISD) or to change the life ycle state of an application. or instance, the command can be used to set the card Manager (ISD) to "TERMINATED" state with P1=80h, P2=FF). When this state is reached, no application can be selected – neither ISD or PIV - and the PRNG elements are zeroized automatically.

Interface Service Description

#### **STORE DATA** – APDU

This APDU command is used to transfer data to an application or the security domain (card manager) processing the command.

#### Table 14 – System Applet Interfaces and Services

#### When PIV Applet is selected the following commands are available:

<ul> <li>EXTERNAL AUTHENTICATE <sup>1</sup>(*) - APDU         This APDU command is used by the card to authenticate the host and to determine the level of security required for all subsequent commands. A previous and successful execution of the INITIALIZE UPDATE <sup>1</sup>(*) - APDU     </li> <li>INITIALIZE UPDATE <sup>1</sup>(*) - APDU     This APDU command initiates the setting up of a secure channel. The card generates the session keys and exchanges data with the host.     </li> <li>MANAGE CHANNEL - APDU         This command is used to open and close supplementary logical channels.     </li> <li>END PERSONALIZATION - APDU         The APDU command is used to one the personalization step.     </li> <li>VERIFY <sup>1</sup> - APDU         The APDU command is used to end the personalization step.     </li> <li>VERIFY <sup>1</sup> - APDU         The APDU command retrieves the data content of the single data object whose tag is given in the data field. The entire object is returned.     </li> <li>GENERAL AUTHENTICATE (*) - APDU         The APDU command performs a cryptographic operation such as INTERNAL AUTHENTICATE, EXTERNAL AUTHENTICATE, MUTUAL AUTHENTICATE, The GENERAL AUTHENTICATE, Gord application key management key with the RSA algorithm) and to perform key unwrap (when using the PIV card application key management key. The public key of the generated key pair is returned as the response to the command.     </li> <li>GENERATE ASYMETRIC KEY PART <sup>1</sup>(*) - APDU         The APDU command initiates the generation and storing in the card of the reference data of an asymmetric key pair i.e., a public key and aprivate key. # 5.2.3 Security rules

The following table presents the security rules applied:

Rule Identifier	Description
ac_co_rule.1	Administrative commands can only be used by the Cryptographic Officer.
ac_java_rule.1	<b>JCRE firewall</b> checks are enforced by the cryptographic module to ensure Java object protection.
ac_life_rule.1	The <b>Card Life Cycle Manager</b> and the <b>Cryptographic Officer</b> are responsible for locking and terminating the Issuer Security Domain life cycle state.
ac_life_rule.2	An <b>applet</b> is responsible for managing its own life cycle state, in accordance with the GP specification.
ac_life_rule.3	The <b>Cryptographic Officer</b> is responsible for managing the life cycle state of any applet (including system applets), in accordance with the GP specification.

#### Table 18 - Security rules

#### 5.3 Additional Gemalto Security Rules

The following rules apply in addition to the FIPS140-2 requirements. The cryptographic module:

Rule Identifier	Description
AD_RULE.1	Does not input/output plain-text private/secret keys or other critical security parameters.
AD_RULE.2	Does not support a multiple concurrent operators.
AD_RULE.3	Does not support a bypass mode.
AD_RULE.4	Does not provide a maintenance role/interface.
AD_RULE.5	Requires re-authentication when changing roles.
AD_RULE.6	Does not allow the loading of Software/Firmware - only applets.

Table 19 - Gemalto additional security rules

#### 5.4 Platform & PIV Security Relevant Data Item

The CM uses the following CSPs:

- GP key set of the Card Manager (\*)
- Secure channel session key (\*)
- Card Holder PIN
- Card Holder II PIN (Also known as the PIN Unblocking Key or PUK)
- The PIV authentication key (\*)
- The PIV card application authentication key (\*)
- The PIV card application digital signature key (\*)
- The PIV card application key management key
- PRNG Seed and seed key (\*)

See Section 9 for additional detail.

The following table defines an association between the services or authentication mechanisms (the interface name is provided) and the CSP they access. The access types are labeled as follows:

- W: write access
- U: the value is not explicitly read, but used within the scope of a comparison or computation process

Interface	CSP	Access type
DELETE	Secure channel session keys (*)	U
EXTERNAL AUTHENTICATE (*)	GP key set of the Card Manager (*) Secure channel session leys (*)	UU
GET STATUS	Secure channel session keys (*)	U
INITIALIZE UPDATE (*)	Secure channel session keys (*) PRNG seed and seed key (*)	U U
INSTALL	Secure channel session keys (*)	U
LOAD	Secure channel session keys (*)	U
PUT DATA	Secure channel session keys (*) PIV card application authentication key (*) PIV card application key management key	U
PUT KEY [TRIPLE-DES, AES] (*)	GP key set of a Security Domain (ISD/SD) (*) Secure channel session leys (*)	W U
PUT KEY [RSA] (*)	RSA public key for DAP verification (*)	W U
SET STATUS	Secure channel session keys (*)	U
STORE DATA	Secure channel session keys (*)	U
GENERAL AUTHENTICATE (*)	PIV keys (*)	U
VERIFY	Card Holder PIN	U
RESET RETRY COUNTER	Unblocking PIN (Card Holder II PIN) Card Holder PIN	U W
CHANGE REFERENCE DATA	Card Holder PIN	W U
GENERATE ASYMMETRIC KEY PAIR (*)	PIV keys (*) Card Holder PIN	W U

**Table 20 - Critical Security Parameters** 

#### 5.5 Approved Mode of Operation

To maintain the module in an approved mode of operation, the operator must restrict the usage of the module as follows:

- The operator of the CM retrieves the ATR from the module to validate that the ATR bytes are the same as those listed in Appendix B.
- The module operates in FIPS mode once the Card is issued and Applets are personalized.
- The module follows all security rules outlined in Section 5 to maintain in FIPS mode.

# 6 Finite State Model

The  $\mathbf{CM}$  is designed using a finite state machine model that explicitly specifies every operational and error state.

The CM includes Power on/off states, Cryptographic Officer states, User services states, applet loading states, Key/PIN loading states, Self-test states, Error states, and the GP life cycle states.

An additional document (Finite State Machine document) identifies and describes all the states of the module including all corresponding state transitions for both platform and PIV Applet.

# 7 Physical Security

The CM single chip module is designed to meet the FIPS140-2 level 3 Physical Security requirements.

#### 7.1 Manufacturing Process

The manufacturing process consist of wire bonding the ICC over printed circuit plate providing ISO contacts and sealing the chip and wires in a 'glue globe':

- Opaque black hard epoxy coating polymerized with temperature

Any mechanical attack attempting to extract the chip from the micro-module results in damaging the chip so that it cannot work anymore. Furthermore, attempts to attack the chip or micro-module will result in signs of tampering such as scratches and deformation.

The module is designed for embedding in a plastic card body for Smart Card manufacturing.

#### 7.2 Hardware Security Mechanisms

Though not tested as part of the module's FIPS 140-2 validation conformance testing, the embedded SLE66CLX1280PE(M) **chip from Infineon** provides the cryptographic module with hardware security mechanisms such as probing detection, low frequency, high temperature, light intensity and supply voltage monitoring. The chip reacts to a light attack, temperature range exceeded, low/high clock frequency, and low/high power supply voltage by resetting the cryptographic module. Any unprotected sensitive data are lost.

Note: the chip is designed in such a way that no data can be collected by visual inspection.

# 8 Operational Environment

This section does not apply to **CM**. No code modifying the behavior of the CM operating system can be added after its manufacturing process.

Only authorized applets can be loaded at post-issuance under control of the Cryptographic Officer. Their execution is controlled by the CM operating system following its security policy rules.

# gemalto<sup>×</sup>

# 9 Cryptographic Key Management

## 9.1 Issuer Security Domain Keys

When the Issuer Security Domain is the selected applet, all commands besides those required to set up the secure channel must be performed within a secure channel. The one exception to this rule relates to the GET DATA APDU command that can be issued to the Issuer Security Domain without first setting up a secure channel.

The card life cycle state determines which modes are available for the secure channel. In the SECURED card life cycle state, all command data must be **secured by at least a MAC**. As specified in the GP specification, there exist earlier states (before card issuance) in which a MAC might not be necessary to send Issuer Security Domain commands. The key set associated with the secure channel is such that:

Secure Channel Protocol is either SCP01 or SCP03 [4][12], depending on configuration (see Table 2 – SCP support configurations):

SCP01 (\*) uses Triple-DES keys 16 bytes:

- All Triple-DES keys are double length keys (16 bytes),
- All Triple-DES operations are performed using triple DES encryption or decryption.
- All MAC generations are computed on 8 bytes.

SCP03 uses AES keys 16 or 32 bytes

- All AES operations are performed using AES encryption or decryption.
- All MAC generations are computed on 16 bytes.

Key sets are identified by Key Version Numbers ('01' to '7F'). The keys within a key set version are used to derive secure channel session keys for the following functionalities:

- Secure Channel Encryption (S-Enc) is used for secure channel authentication and encryption.
- Secure Channel Message Authentication Code Key (S-Mac) is used for secure channel MAC verification.
- Data Encryption Key (DEK) is used for sensitive data encryption.

## 9.2 Application provider Security Domain Keys

As the Issuer Security Domain is the on-card representative of the Card Issuer, an Application Provider Security Domain, or simply a Security Domain, is the on-card representative of an Application Provider.

Applets may rely on a Security Domain different from the Issuer Security Domain and use keys of various types through the cryptographic services of the module: Triple-DES keys, AES keys, RSA public and private keys, RSA Chinese Remainder public and private keys, and ECDSA public and private keys (supported by the platform).

In addition, a Public RSA key (1024 bits) may be loaded into the module, to verify the Data Authentication Pattern (DAP) (\*) when loading an applet. This feature is only available in a Security Domain with DAP verification privilege. For more detail, see **GP[4]** specification.

Applet key management is out of the scope of this security policy.

# 9.3 PIV Application Keys

**PIV Applet** use keys of the following key types through the cryptographic services of the module: Triple-DES Keys, RSA public and private keys

#### 9.3.1 PIV Applet Key management:

The PIV Applet manages five types of keys through the platform cryptographic services:

• The *PIV authentication key (\*)*: This key (asymmetric RSA) is generated on the card. This key is used to support card authentication for an interoperable environment, and it is a **mandatory non exportable key**.

This key shall be generated on the PIV Card. The PIV Card shall not permit exportation of the PIV authentication key. The PIV authentication key must be available only through the contact interface of the PIV Card. Private key operations may be performed using an activated PIV Card without explicit user action (e.g., the PIN need not be supplied for each operation).

- The *PIV card application administration key:* This key is a symmetric Triple DES key. It may be used for personalization and post-issuance activities. The PIV Card shall not permit exporting the card authentication key. This key shall be imported to the card and allows authentication of the Card Application Administrator.
- The *PIV card application digital signature key (\*)*: This key (asymmetric RSA) may support document signing.
   The PIV digital signature key shall be generated on the PIV Card. The PIV Card shall not permit exporting the digital signature key. If present, cryptographic operations using the digital signature key may only be performed using the contact interface of the PIV Card. Private key operations may not be performed without explicit user action.
- The *PIV card application key management key*: This key (asymmetric RSA)may support key establishment and transport. This Key may be used as an encryption key. This key may be generated (\*) on the PIV Card or imported to the card. If present, the key management key must only be accessible using the contact interface of the PIV Card. This key is sometimes called an encryption key or a cipher key.
- The *PIV card authentication key (\*)*: This key (asymmetric RSA) may be used for physical access control. The PIV card authentication key shall be generated on the PIV Card. The PIV Card shall not permit exportation of the card authentication key.

#### 9.3.2 PIV Applet security domain

It is possible to open a secure channel during the personalization phase and also application mode of the PIV Applet by using the security domain of the java platform. During the personalization, the applet restricts the use of authentication mechanism, defined in GP. Only the mode 3 is allowed when the Card Manager state is "SECURED", and modes 1, 2 and 3 if Card Manager state is "INITIALIZED" or "OP\_READY".

#### 9.4 Key Generation

The platform on-board key generation is able to generate ECDSA key, RSA key (\*) and RSA Chinese Remainder Keys (\*).

For the **PIV Applet asymmetric keys**, the card stores a corresponding X.509 certificate.

The PIV Card imports and stores a corresponding X.509 certificate to support validation of the corresponding private key.

Keys are generated in the CM using the GENERATE ASYMMETRIC KEY PAIR command (\*).

#### 9.5 PIV Application Key Entry

Keys are entered in the CM using the PUT DATA APDU command of the PIV Applet and with the authentication of Card Holder, Card Application Administrator or Crypto Officer. The PIV Applet ensures that Secure Channel is MAC+ENCRYPT so that keys are entered in encrypted form.

The PIV Applets key set structure is presented to the card in plaintext. The key set structure includes a checksum for each key in order to ensure their integrity.

#### 9.6 Security Domain Key Entry

Keys are entered in the cryptographic module using the PUT KEY APDU command and under the responsibility of the applets. Non-system applets are out of the scope of this Security Policy.

# The Issuer Security Domain or a Security Domain enforces entering cryptographic symmetric keys securely within a secure channel.

The Cryptographic Officer (of the Card Issuer) sends the PUT KEY APDU command to:

- Replace multiple keys within an existing key set version.
- Replace an existing key set version with a new key set version.
- Add a new key set version containing multiple key(s).

The Security Domain key set already present within the cryptographic module is the default key set. If this key set version is replaced, the replacement becomes the default.

The User (of the Application Provider) sends the PUT KEY APDU command to:

• Add a RSA public key for DAP verification.

#### 9.6.1 Input Data

While the key set structure can be presented to the card in encrypted form or in plaintext, the key values are always encrypted with the Data Encryption Key.

The key set structure includes a check value for each key in order to ensure their integrity.

#### 9.7 Key Storage

Keys are protected against unauthorized disclosure, unauthorized modification, and unauthorized substitution.

Secret and private keys are Java objects. As a consequence, they are protected by the firewall from illegal access. An applet that owns a key is responsible for not sharing it.

The Java inheritance mechanism ensures that a created Java object such as a key belongs to its owner, that is an applet and its execution context.

The cryptographic module stores key components according to the key type.

КЕҮ ТҮРЕ	KEY COMPONENT		
Triple-DES keys	Key value component		
AES keys	Key value component		
	Public exponent e component		
RSA keys	Modulus N component		
-	Private exponent d component		
ECDSA	Private scalar d		
(supported by			
the platform)			
	Chinese Remainder P component		
	Chinese Remainder <b>Q</b> component		
RSA Keys CRT	Chinese Remainder PQ component		
	Chinese Remainder DP1 component		
	Chinese Remainder DQ1 component		

#### Table 21 - Key types and components mapping table

The PIN is a critical security parameter that is a java object and is stored encrypted.

#### 9.8 Key Zeroization

The cryptographic module provides applets with the capability to set all plaintext cryptographic keys and other unprotected critical security parameters within the module to zero or random values (see Table 15 - PIV Applet Interfaces and Services

All CSPs, including the GP key set, Secure channel session key, PRNG seed and PRNG key, and RSA public key can be zeroized with a PUT KEY command and then by setting the card state to TERMINATED with a SET STATUS command (see Table 14 – System Applet Interfaces and Services

# 10 EMI/EMC

The Protiva<sup>™</sup> PIV v1.55 on TOP DL v2 Card cryptographic module has been tested to meet the EMI/EMC requirements specified in FCC Part 15 Subpart J, Class B.

# **11 Self Tests**

The TOP DL V2 performs the following self-tests to ensure that the module works properly.

SELF-TESTS	EXECUTION
Cryptographic algorithm test (Known-answer tests for Triple-DES (*), AES, SHA-1, SHA-256, SHA-384, SHA-512, RSA (*), ECDSA (*))	At Power-Up
Software/firmware integrity test.	At Power-Up
Pseudo Random Number Generator test. (Known-Answer Test for PRNG (*) output)	At Power-Up
Pair-wise consistency test (*) (RSA On Board key Generation and EC Key Generation)	Conditional
Software load test.	Conditional
Continuous random number generator test (*).	Conditional

Table 22 - Self-tests list

#### **11.1 Self-Test Execution**

After power up and on receipt of the first APDU command, the CM enters the self-test state and performs all of the cryptographic algorithm and software integrity self-tests as specified in FIPS 140-2 standard **[1]**. In addition to those tests, it also performs chip sensors verification and security status verification:

- Sensors test: at startup, the card detects if a hardware security error has been held during the previous session. If so, the card enters a mute state.
- Security errors test: at startup, if a pre-defined number of security errors is reached, the card is terminated as per Global Platform specifications. The GET DATA command is the only command that remains available.

These tests are conducted automatically as part of the normal functions of the CM. They do not require any additional operator intervention, nor applet specific functions.

Power-up self-tests are executed upon reset after the first APDU command is issued. The CM start-up process has been designed in such a way that it cannot be bypassed. This enforces the execution of the self-tests before allowing any use and administration of the module, thus guaranteeing a secure execution of the module's cryptographic services.

If these self-tests are passed successfully, the CM returns the status words relating to the requested APDU command via the status interface and incoming APDUs are processed.

All data output via the output interface are inhibited while any power-up and conditional self-test is running.

Resetting the CM, provides a means by which the operator can repeat the full sequence of power-up operating tests.

## 11.2 Self-Test Failure

No cryptographic operations can be processed and no data can be output via the data output interface, while in the error state.

If an error occurs during the **SW load self-test**, an error code is returned via the status interface and the secure channel is closed (loading is aborted).

If an error occurs during another self-test, the card enters a state where no more command can be performed. The behavior of the card depends on error:

- Severity level 1 error:
  - integrity test, internal error counter is incremented, the card returns an error status before becoming mute.
- Severity level 2 error:
  - cryptographic algorithms tests, internal error counter is incremented, the card returns an error status before becoming mute.
  - conditional self-tests (PRNG continuous test (\*) and pair wise consistency test (\*)), internal error counter is incremented, the card returns an error status before becoming mute.

When the internal error counter reaches a certain value the card becomes mute.

An error while loading an applet closes the secure channel with the Card Manager. It shall be re-opened, to retry applet loading: the Cryptographic Officer has to be re-authenticated.

# **12 Design Assurance**

The CM meets the Level 3 Design Assurance section requirements.

#### **12.1 Configuration Management**

The CM is designed and developed using a configuration management system that is operated with clear rules.

An additional document (Configuration Management Plan document) defines the methods, mechanisms and tools that allow to identify and place under control all the data and information concerning the specification, design, implementation, generation, test and validation of the card software throughout the development and validation cycle.

#### 12.2 Delivery and Operation

The  $\ensuremath{\text{CM}}$  is designed and developed using a configuration management system that is operated with clear rules.

Some additional documents ('Delivery and Operation', 'Reference Manual', 'Card Initialization Specification' and 'Applet Initialization Specification' documents) define and describe the steps necessary to deliver and operate the **CM** securely.

#### 12.3 Guidance Documents

The Guidance document provided with CM is intended to be the 'Reference Manual'. This a document is designed to allow a secure operation of the CM by its users as defined in the 'Roles, Services and Authentication' chapter.

# **13 PIV Applet Guidance**

At the time the card is issued, the PIV Applet shall be personalized with the appropriate data. Personalization includes PIV keys and PIN values. Personalization may be performed using a secure channel (ciphertext) or in plaintext, as required by the operator.

The following rules must be observed for conformance to FIPS 201-1 and FIPS 140-2:

- 1. The PIN shall be 7 bytes or greater.
- 2. The PIN shall be composed of numeric characters.

# 14 Mitigation of other attacks

The TOP DL V2 has been designed to mitigate the following attacks:

- Timing Attacks,
- Differential Power Analysis,
- Simple Power Analysis,
- Electromagnetic Analysis,
- Fault Attack.
- Card Tearing

A separate and proprietary document describes the mitigation of attacks policy provided by the TOP DL V2 platform.

# 15 Appendix A – GP Specification

This chapter provides relationships between the cryptographic module APDU commands and the GP specifications.

APDU COMMAND	GLOF	<b>DOCUMENTATION:</b> BAL PLATFORM SPECIFICATION GP211 [4] OR GP22 [12].
DELETE	CHAPTER 9	SECTION 2
EXTERNAL AUTHENTICATE (*)	APPENDIX D	SECTION 4 (SCP 01)
EXTERNAL AUTHENTICATE	CHAPTER 7	SECTION 1 (SCP 03 – GP22)
GET DATA	CHAPTER 9	SECTION 3
GET STATUS	CHAPTER 9	SECTION 4
INITIALIZE UPDATE (*)	APPENDIX D	SECTION 4 (SCP 01)
INITIALIZE UPDATE (*)	CHAPTER 7	SECTION 1 (SCP 03 – GP22)
INSTALL	CHAPTER 9	SECTION 5
LOAD	CHAPTER 9	SECTION 6
MANAGE CHANNEL	CHAPTER 9	SECTION 7
PUT DATA	CHAPTER 4	SECTION 12 (OP 2.0.1' SPECIFICATION)
PUT KEY (*)	CHAPTER 9	SECTION 8
PUT KEY	CHAPTER 7	SECTION 2 (AES KEYS – GP22)
SELECT	CHAPTER 9	SECTION 9
SET STATUS	CHAPTER 9	SECTION 10
STORE DATA	CHAPTER 9	SECTION 11

Table 23 - Relationships between APDU commands and GP Specifications

The constraints of use for each APDU commands are described in subsection 1 "Definition and scope".

The correct values of the **APDU parameters** (P1, P2, LC, and LE) are described in subsection 2 "Command message".

The conditions of use of the APDU commands correspond to the authorized sequences of APDU commands.

# 16 Appendix B – Identification and FIPS mode

- 1. CPLC data element can be read with a Get Data command (tag 9F7Fh): In the FIPS mode, the first 6 bytes of the CPLC data (tag 9F 7Fh) must be: IC Fabricator - 40 90h IC Type - 61 28h Operating System Identifier: 12 91h Operating System release level: 01 00h These values identify clearly: The Firmware version: Build#11 - M1005011 + Softmask V03 + PIV Applet v1.55 and the Part (Hardware version): A1023378 of the validated module. 2. The flow Identification byte must be **1x** value to indicate **FIPS configuration**. x depends on the SCP configuration of the card (x = 11h for SCP01, x = 13h for SCP03-00 and x = 1000000017h for SCP03-10) This byte can be retrieved issuing a Get Data using tag 01 01h. The tag 01 01h can be broken down as follow: Card serial number: 8 bytes Reserved bytes: 3 bytes Flow identification: 1 byte
  - Reserved bytes: 4 bytes
- 3. A card in FIPS configuration must have following historical bytes T5-T9 in the ATR :

T5 = FMN	B0h	Gemalto Family Name – JavaCard financial/e-business
T6 = PRN	83h	Gemalto Product Name – TOP DL V2
T7 = OSV	11h	Gemalto OS Version – TOP DL V2
T8 = PRV	1xh	Gemalto Program Version or Custom – Flow ID byte
T9 = CID	E5h	Gemalto Chip Identifier – Infineon SLE66CLX1280PE

"SECURED" must be the required state for card delivery outside Gemalto. The CO must check the state to ensure it is OP\_SECURED to be in FIPS mode.

If card state is not OP\_SECURED both CO and User must open secure channel in at least MAC mode.
