Subject: ROUND 2 OFFICIAL COMMENT: NTS-KEM

Hello,

I have found a bug for this submission when the variable "_WIN32" is defined. The bug exists in the file "matrix_ff2.c" on line 39.

There is a property called "rows" that is being accessed from the object "M". After looking at the type definition of "matrix_ff2", this property should be called "nrows" not "rows". After making this change, I was able to build and run this as a DLL in a windows environment.

Kind regards,

Tom Norris
