

The attached DRAFT document (provided here for historical purposes) has been superseded by the following publication:

Publication Number: **NIST Special Publication (SP) 800-73-4**

Title: **Interfaces for Personal Identity Verification**

Publication Date: **May 2015 (updated 2/8/2016)**

- Final Publication: <https://doi.org/10.6028/NIST.SP.800-73-4> (which links to <http://nvlpubs.nist.gov/nistpubs/SpecialPublications/NIST.SP.800-73-4.pdf>).
- Information on other NIST Computer Security Division publications and programs can be found at: <http://csrc.nist.gov/>

The following information was posted with the attached DRAFT document:

May 13, 2013

**SP 800-73-4**

***DRAFT Interfaces for Personal Identity Verification (3 Parts)***

***Part 1- PIV Card Application Namespace, Data Model and Representation***

***Part 2- PIV Card Application Card Command Interface***

***Part 3- PIV Client Application Programming Interface***

NIST announces that ***Draft Special Publication (SP) 800-73-4, Interfaces for Personal Identity Verification***, has been released for public comment. The Draft SP 800-73-4 is updated to align with Candidate Final FIPS 201-2. Major changes in Draft SP 800-73-4 include:

- Removal of Part 4, *The PIV Transitional Data Model and Interfaces*;
- The addition of specifications for secure messaging and the virtual contact interface, both of which are optional to implement;
- The specification of an optional Cardholder Universally Unique Identifier (UUID) as a unique identifier for a cardholder;
- The specification of an optional on-card biometric comparison mechanism, which may be used as a means of performing card activation and as a PIV authentication mechanism; and
- The addition of a requirement for the PIV Card Application to enforce a minimum PIN length of six digits.

Except for minor editorial changes, all changes can be reviewed with the track-change version (See Track Change file for Part 1-3 below) of Draft SP 800-73-4.

NIST requests comments on Draft SP 800-73-4 by 5:00pm EDT on **June 14, 2013**. Please submit your comments, using the comment template form (see last link for this draft below) to [piv\\_comments@nist.gov](mailto:piv_comments@nist.gov) with "Comments on Public Draft SP 800-73-4" in the subject line.

**Authority**

70 This publication has been developed by NIST to further its statutory responsibilities under the Federal  
71 Information Security Management Act (FISMA), Public Law (P.L.) 107-347. NIST is responsible for  
72 developing information security standards and guidelines, including minimum requirements for Federal  
73 information systems, but such standards and guidelines shall not apply to national security systems  
74 without the express approval of appropriate Federal officials exercising policy authority over such  
75 systems. This guideline is consistent with the requirements of the Office of Management and Budget  
76 (OMB) Circular A-130, Section 8b(3), Securing Agency Information Systems, as analyzed in Circular  
77 A-130, Appendix IV: Analysis of Key Sections. Supplemental information is provided in Circular A-  
78 130, Appendix III, Security of Federal Automated Information Resources.

79 Nothing in this publication should be taken to contradict the standards and guidelines made mandatory  
80 and binding on Federal agencies by the Secretary of Commerce under statutory authority. Nor should  
81 these guidelines be interpreted as altering or superseding the existing authorities of the Secretary of  
82 Commerce, Director of the OMB, or any other Federal official. This publication may be used by  
83 nongovernmental organizations on a voluntary basis and is not subject to copyright in the United States.  
84 Attribution would, however, be appreciated by NIST.

## Reports on Computer Systems Technology

111 The Information Technology Laboratory (ITL) at the National Institute of Standards and Technology  
112 (NIST) promotes the U.S. economy and public welfare by providing technical leadership for the  
113 Nation’s measurement and standards infrastructure. ITL develops tests, test methods, reference data,  
114 proof of concept implementations, and technical analyses to advance the development and productive  
115 use of information technology. ITL’s responsibilities include the development of management,  
116 administrative, technical, and physical standards and guidelines for the cost-effective security and  
117 privacy of other than national security-related information in Federal information systems. The Special  
118 Publication 800-series reports on ITL’s research, guidelines, and outreach efforts in information system  
119 security, and its collaborative activities with industry, government, and academic organizations.

121  
122

### Abstract

123 FIPS 201 defines the requirements and characteristics of a government-wide interoperable identity  
124 credential. FIPS 201 also specifies that this identity credential must be stored on a smart card. This  
125 document, SP 800-73, contains the technical specifications to interface with the smart card to retrieve  
126 and use the PIV identity credentials. The specifications reflect the design goals of interoperability and  
127 PIV Card functions. The goals are addressed by specifying a PIV data model, card edge interface, and  
128 application programming interface. Moreover, this document enumerates requirements where the  
129 international integrated circuit card standards [ISO7816] include options and branches. The  
130 specifications go further by constraining implementers’ interpretations of the normative standards. Such  
131 restrictions are designed to ease implementation, facilitate interoperability, and ensure performance, in a  
132 manner tailored for PIV applications.

## 241 1. Introduction

242 Homeland Security Presidential Directive-12 (HSPD-12) called for a common identification standard to  
243 be adopted governing the interoperable use of identity credentials to allow physical and logical access to  
244 Federally controlled facilities and information systems. Personal Identity Verification (PIV) of Federal  
245 Employees and Contractors, Federal Information Processing Standard 201 (FIPS 201) [FIPS201] was  
246 developed to establish standards for identity credentials. Special Publication 800-73-4 (SP 800-73-4)  
247 contains technical specifications to interface with the smart card (PIV Card<sup>1</sup>) to retrieve and use the  
248 identity credentials.

### 249 1.1 Purpose

250 FIPS 201 defines procedures for the PIV lifecycle activities including identity proofing, registration, PIV  
251 Card issuance, and PIV Card usage. FIPS 201 also specifies that the identity credentials must be stored  
252 on a smart card. SP 800-73-4 contains the technical specifications to interface with the smart card to  
253 retrieve and use the identity credentials. The specifications reflect the design goals of interoperability and  
254 PIV Card functions. The goals are addressed by specifying a PIV data model, card edge interface, and  
255 application programming interface. Moreover, SP 800-73-4 enumerates requirements where the  
256 international integrated circuit card (ICC) standards [ISO7816] include options and branches. The  
257 specifications go further by constraining implementers' interpretations of the normative standards. Such  
258 restrictions are designed to ease implementation, facilitate interoperability, and ensure performance, in a  
259 manner tailored for PIV applications.

### 260 1.2 Scope

261 SP 800-73-4 specifies the PIV data model, application programming interface (API), and card interface  
262 requirements necessary to comply with the use cases, as defined in Section 6 of FIPS 201 and further  
263 described in Appendix B of SP 800-73-4 Part 1. Interoperability is defined as the use of PIV identity  
264 credentials such that client-application programs, compliant card applications, and compliant ICCs can be  
265 used interchangeably by all information processing systems across Federal agencies. SP 800-73-4 defines  
266 the PIV data elements' identifiers, structure, and format. SP 800-73-4 also describes the client application  
267 programming interface and card command interface for use with the PIV Card.

268 This part, SP 800-73-4 Part 2 – *PIV Card Application Card Command Interface*, contains the technical  
269 specifications of the PIV Card command interface to the PIV Card. The specification defines the set of  
270 commands surfaced by the PIV Card Application at the card edge of the ICC.

### 271 1.3 Audience and Assumptions

272 This document is targeted at Federal agencies and implementers of PIV systems. Readers are assumed to  
273 have a working knowledge of smart card standards and applications.

274 Readers should also be aware of SP 800-73-4 Part 1, Section I, for the revision history of SP 800-73,  
275 Section II, which details configuration management recommendations, and Section III, which specifies  
276 NPVP conformance testing procedures. Section 1.3 of Part 1 specifies the effective date of SP 800-73-4.

---

<sup>1</sup> A physical artifact (e.g., identity card, "smart" card) issued to an individual that contains a PIV Card Application which stores identity credentials (e.g., photograph, cryptographic keys, digitized fingerprint representation) so that the claimed identity of the cardholder can be verified against the stored credentials by another person (human readable and verifiable) or an automated process (computer readable and verifiable).

277 **1.4 Content and Organization**

278 All sections in this document are *normative* (i.e., mandatory for compliance) unless specified as  
279 *informative* (i.e., non-mandatory). Following is the structure of Part 2:

- 280 + Section 1, *Introduction*, provides the purpose, scope, audience, and assumptions of the document  
281 and outlines its structure.
- 282 + Section 2, *Overview: Concepts and Constructs*, describes the model of computation of the PIV  
283 Card Application and the PIV client application programming interface including information  
284 processing concepts and data representation constructs.
- 285 + Section 3, *PIV Card Application Card Command Interface*, describes the set of commands  
286 accessible by the PIV Middleware to communicate with the PIV Card Application.
- 287 + Section 4, *Secure Messaging*, describes the secure messaging protocol that is used to enable data  
288 confidentiality and integrity.
- 289 + Appendix A, *Examples of the Use of the GENERAL AUTHENTICATE Command*, demonstrates  
290 the GENERAL AUHTENTICATE command. This section is *informative*.
- 291 + Appendix B, *Terms, Acronyms, and Notation*, contains the list of terms and acronyms used in this  
292 document and explains the notation in use. This section is *informative*.
- 293 + Appendix C, *References*, contains the lists of documents used as references by this document.  
294 This section is *informative*.

**2. Overview: Concepts and Constructs**

SP 800-73-4 Parts 2 and 3 define two interfaces to an ICC that contains the PIV Card Application: a low-level card command interface (Part 2) and a high-level client API (Part 3).

The information processing concepts and data constructs on both interfaces are identical and may be referred to generically as the information processing concepts and data constructs on the *PIV interfaces* without specific reference to the client API or the card command interface.

The client API provides task-specific programmatic access to these concepts and constructs and the card command interface provides communication access to concepts and constructs. The client API is used by client applications using the PIV Card Application. The card command interface is used by software implementing the client API (middleware).

The client API is thought of as being at a higher level than the card command interface because access to a single entry point on the client API may cause multiple card commands to traverse the card command interface. In other words, it may require more than one card command on the card command interface to accomplish the task represented by a single call on an entry point of the client API.

The client API is a program execution, call/return style interface whereas the card command interface is a communication protocol, command/response style interface. Because of this difference, the representation of the PIV concepts and constructs as bits and bytes on the client API may be different from the representation of these same concepts and constructs on the card command interface.

**2.1.1 Platform Requirements**

The following are the requirements that the PIV Card Application places on the ICC platform on which it is implemented or installed:

- + global security status that includes the security status of a global cardholder PIN
- + application selection using a truncated Application Identifier (AID)
- + ability to reset the security status of an individual application
- + indication to applications as to which physical communication interface – contact versus contactless – is in use
- + support for the default selection of an application upon warm or cold reset

**2.2 Namespaces of the PIV Card Application**

AID, names, Tag-Length-Value (BER-TLV) tags [ISO8825], ASN.1 Object Identifiers (OIDs) [ISO8824] and Proprietary Identifier eXtensions (PIXes) of the NIST Registered Application Provider Identifier (RID) used on the PIV interfaces are specified in Part 1. Part 1 also specifies that all unspecified names, BER-TLV tags, OIDs, and values of algorithm identifiers, key references, and cryptographic mechanism identifiers, are reserved for future use.

## 329 2.3 Card Applications

330 Each command that appears on the card command interface shall be implemented by a *card application*  
331 that is resident on the ICC. The card command enables operations on and with the data objects to which  
332 the card application has access.

333 Each card application shall have a globally unique name called its Application Identifier (AID) [ISO7816,  
334 Part 4]. Except for the default applications, access to the card commands and data objects of a card  
335 application shall be gained by selecting the card application using its application identifier<sup>2</sup>. The PIX of  
336 the AID shall contain an encoding of the version of the card application. The AID of the PIV Card  
337 Application is defined in Part 1.

338 The card application whose commands are currently being used is called the *currently selected*  
339 *application*.

### 340 2.3.1 Default Selected Card Application

341 The card platform shall support a default selected card application. In other words, there shall be a  
342 currently selected application immediately after a cold or warm reset. This card application is the default  
343 selected card application. The default card application may be the PIV Card Application, or it may be  
344 another card application.

## 345 2.4 Security Architecture

346 The security architecture of an ICC is the means by which the security policies governing access to each  
347 data object stored on the card are represented within the card.

348 These security policy representations are applied to all PIV card commands thereby ensuring that the  
349 prescribed data policies for the card applications are enforced.

350 The following subsections describe the security architecture of the PIV Card Application.

### 351 2.4.1 Access Control Rule

352 An *access control rule* shall consist of an *access mode* and a *security condition*. The access mode is an  
353 operation that can be performed on a data object. A security condition is a Boolean expression using  
354 variables called security statuses that are defined below.

355 According to an access control rule, the action described by the access mode can be performed on the data  
356 object if and only if the security condition evaluates to TRUE for the current values of the security  
357 statuses. If there is no access control rule with an access mode describing a particular action, then that  
358 action shall never be performed on the data object.

### 359 2.4.2 Security Status

360 Associated with each authenticable entity shall be a set of one or more Boolean variables, each called a  
361 *security status indicator* of the authenticable entity. Each security status indicator, in turn, is associated

---

<sup>2</sup> Access to the default application, and its commands and objects, occurs immediately after a warm or cold card reset without an explicit SELECT command.

362 with a credential that can be used to authenticate the entity. The security status indicator of an  
363 authenticable entity shall be TRUE if the credentials associated with the security status indicator of the  
364 authenticable entity have been authenticated and FALSE otherwise.

365 A successful execution of an authentication protocol shall set the security status indicator associated with  
366 the credential used in the protocol to TRUE. An aborted or failed execution of an authentication protocol  
367 shall set the security status indicator associated with the credential used in the protocol to FALSE.

368 As an example, the credentials associated with three security status indicators of the cardholder might be:  
369 PIN, primary fingerprint, and secondary fingerprint. Demonstration of knowledge of the PIN is the  
370 authentication protocol for the first security status indicator wherein the PIN is the credential.  
371 Comparison of the fingerprint template on the card with a fingerprint acquired from the cardholder is the  
372 authentication protocol for the other two security status indicators wherein the fingerprint is the  
373 credential. A security condition using these three security status indicators might be “PIN **AND** (primary  
374 fingerprint **OR** secondary fingerprint).”

375 A security status indicator shall be said to be a *global* security status indicator if it is not changed when  
376 the currently selected application changes from one application to another. In essence, when changing  
377 from one application to another, the global security status indicators shall remain unchanged.

378 A security status indicator is said to be an *application* security status indicator if it is set to FALSE when  
379 the currently selected application changes from one application to another. Every security status indicator  
380 is either a global security status indicator or an application security status indicator. The security status  
381 indicators associated with the PIV Card Application PIN, the PIN Unblocking Key (PUK), the primary  
382 finger OCC, the secondary finger OCC, Pairing Code, and the PIV Card Application Administration Key  
383 are application security status indicators for the PIV Card Application, whereas the security status  
384 indicator associated with the Global PIN is a global security status indicator.

385 The term *global security status* refers to the set of all global security status indicators. The term  
386 *application security status* refers to the set of all application security status indicators for a specific  
387 application.

### 388 **2.4.3 Authentication of an Individual**

389 Knowledge of a PIN is the means by which an individual can be authenticated to the PIV Card  
390 Application.

391 The PIV Card Application PIN and the pairing code shall each be between 6 and 8 bytes in length. If the  
392 actual length of PIV Card Application PIN or pairing code is less than 8 bytes it shall be padded to 8  
393 bytes with 'FF' when presented to the card command interface. The 'FF' padding bytes shall be appended  
394 to the actual value of the PIN. The bytes comprising the PIV Card Application PIN and pairing code shall  
395 be limited to values 0x30 – 0x39, the ASCII values for the decimal digits '0' – '9'. For example,

396 + Actual PIV Card Application PIN: “123456” or '31 32 33 34 35 36'

397 + Padded PIV Card Application PIN presented to the card command interface: '31 32 33 34 35 36  
398 FF FF'

399 The PIV Card Application shall enforce the minimum length requirement of six bytes for the PIV Card  
400 Application PIN and pairing code (i.e., shall verify that at least the first six bytes of the value presented to  
401 the card command interface are in the range 0x30 – 0x39).

402 If the Global PIN is used by the PIV Card Application then the above encoding, length, padding, and  
 403 enforcement of minimum PIN length requirements for the PIV Card Application PIN shall apply to the  
 404 Global PIN.

405 The PUK shall be 8 bytes in length, and the bytes comprising the PUK shall be limited to the values 0x00  
 406 – 0xFE (i.e., shall not include 'FF'). The PIV Card Application shall enforce the PUK length requirement  
 407 of eight bytes (i.e., shall verify that all eight bytes of the value presented to the card command interface  
 408 are in the range 0x00 – 0xFE).

## 409 2.5 Current State of the PIV Card Application

410 The elements of the *current state* of the PIV Card Application when the PIV Card Application is the  
 411 currently selected application are described in Table 1.

412 **Table 1. State of the PIV Card Application**

State Name	Always Defined	Comment	Location of State
Global security status	Yes	Contains security status indicators that span all card applications on the platform.	PIV Platform
Currently selected application	Yes	The platform shall support the selection of a card application using the full application identifier or by providing the right-truncated version and there shall always be a currently selected application.	PIV Platform
Application security status	Yes	Contains security status indicators local to the PIV Card Application.	PIV Card Application

413

414 **3. PIV Card Application Card Command Interface**

415 Table 2 lists the card commands surfaced by the PIV Card Application at the card edge of the ICC when it  
 416 is the currently selected card application. All PIV Card Application card commands shall be supported by  
 417 a PIV Card Application. Card commands indicated with a 'Yes' in the Command Chaining column shall  
 418 support command chaining for transmitting a data string too long for a single command as defined in  
 419 [ISO7816].

420 **Table 2. PIV Card Application Card Commands**

Type	Name	Contact Interface	Contactless Interface	Security Condition for Use	Command Chaining
PIV Card Application Card Commands for Data Access	<b>SELECT</b>	Yes	Yes	Always	No
	<b>GET DATA</b>	Yes	Yes	Data Dependent. See Table 2, Part 1.	No
PIV Card Application Card Commands for Authentication	<b>VERIFY</b>	Yes	SM or VCI	Always	Yes <sup>3</sup>
	<b>CHANGE REFERENCE DATA</b>	Yes	VCI	PIN	No
	<b>RESET RETRY COUNTER</b>	Yes	No	PIN Unblocking Key	No
	<b>GENERAL AUTHENTICATE</b>	Yes	Yes (See Note)	Key Dependent. See Table 4, Part 1.	Yes
PIV Card Application Card Commands for Credential Initialization and Administration	<b>PUT DATA</b>	Yes	No	PIV Card Application Administrator	Yes
	<b>GENERATE ASYMMETRIC KEY PAIR</b>	Yes	No	PIV Card Application Administrator	Yes

421

422 The PIV Card Application shall return the status word of '6A 81' (Function not supported) when it  
 423 receives a card command on the contactless interface marked "No" in the Contactless Interface column in  
 424 Table 2.

425 Note: Cryptographic protocols using private/secret keys that require the "PIN" or "OCC" security  
 426 condition shall only be used on the contactless interface after a Virtual Contact Interface (VCI) has been  
 427 established.

<sup>3</sup> The VERIFY command is only required to support command chaining if the PIV Card Application supports on-card biometric comparison (OCC).

428 **3.1 PIV Card Application Card Commands for Data Access**429 **3.1.1 SELECT Card Command**

430 The SELECT card command sets the currently selected application. The PIV Card Application shall be  
431 selected by providing its application identifier (see Part 1, Section 2.2) in the data field of the SELECT  
432 command.

433 There shall be at most one PIV Card Application on any ICC. The PIV Card Application can also be  
434 made the currently selected application by providing the right-truncated version (see Part 1, Section 2.2);  
435 that is, without the two-byte version number in the data field of the SELECT command.

436 The complete AID, including the two-byte version, of the PIV Card Application that became the currently  
437 selected card application upon successful execution of the SELECT command (using the full or right-  
438 truncated PIV AID) shall be returned in the application property template.

439 If the currently selected application is the PIV Card Application when the SELECT command is given  
440 and the AID in the data field of the SELECT command is either the AID of the PIV Card Application or  
441 the right-truncated version thereof, then the PIV Card Application shall continue to be the currently  
442 selected card application and the setting of all security status indicators in the PIV Card Application shall  
443 be unchanged.

444 If the currently selected application is the PIV Card Application when the SELECT command is given  
445 and the AID in the data field of the SELECT command is not the PIV Card Application (or the right-  
446 truncated version thereof), but a valid AID supported by the ICC, then the PIV Card Application shall be  
447 deselected and all the PIV Card Application security status indicators in the PIV Card Application shall  
448 be set to FALSE.

449 If the currently selected application is the PIV Card Application when the SELECT command is given  
450 and the AID in the data field of the SELECT command is an invalid AID not supported by the ICC, then  
451 the PIV Card Application shall remain the currently selected application and all PIV Card Application  
452 security status indicators shall remain unchanged.

453 **Command Syntax**

<b>CLA</b>	'00'
<b>INS</b>	'A4'
<b>P1</b>	'04'
<b>P2</b>	'00'
<b>L<sub>c</sub></b>	Length of application identifier
<b>Data Field</b>	AID of the PIV Card Application using the full AID or the right-truncated AID (See Section 2.2, Part 1)
<b>L<sub>e</sub></b>	Length of application property template

454

455 **Response Syntax**

<b>Data Field</b>	Application property template (APT). See Table 3 below
<b>SW1-SW2</b>	Status word

456

457 Upon selection, the PIV Card Application shall return the application property template described in  
458 Table 3.

459

460

**Table 3. Data Objects in the PIV Card Application Property Template (Tag '61')**

Description	Tag	M/O/C	Comment
Application identifier of application	'4F'	M	The PIX of the AID includes the encoding of the version of the PIV Card Application. See Section 2.2, Part 1.
Coexistent tag allocation authority	'79'	M	Coexistent tag allocation authority template. See Table 4.
Application label	'50'	O	Text describing the application; e.g., for use on a man-machine interface.
Uniform resource locator	'5F50'	O	Reference to the specification describing the application.
Cryptographic algorithms supported	'AC'	C	Cryptographic algorithm identifier template, see Table 5.

461

462

**Table 4. Data Objects in a Coexistent Tag Allocation Authority Template (Tag '79')**

Name	Tag	M/O	Comment
Application identifier	'4F'	M	See Section 2.2, Part 1

463

464 A PIV Card Application may use a subset of the cryptographic algorithms defined in SP 800-78. Tag  
465 0xAC encodes the cryptographic algorithms supported by the PIV Card Application. The encoding of the  
466 tag 0xAC shall be as specified in Table 5. Each instance of tag 0x80 shall encapsulate one algorithm.  
467 The presence of cryptographic algorithm identifier 0x27 or 0x2B indicates the PIV Card Application  
468 supports secure messaging. Tag 0xAC shall be present and indicate algorithm identifier 0x27 and/or  
469 0x2B when the PIV Card Application supports secure messaging.

470

**Table 5. Data Objects in a Cryptographic Algorithm Identifier Template (Tag 'AC')**

Name	Tag	M/O	Comment
Cryptographic algorithm identifier	'80'	M	For values see Table 5 of Part 1 and [SP800-78, Table 6-2]
Object identifier	'06'	M	Its value is set to 0x00

471

472

SW1	SW2	Meaning
'6A'	'82'	Application not found
'90'	'00'	Successful execution

473

474

475 **3.1.2 GET DATA Card Command**

476 The GET DATA card command retrieves the data content of the single data object whose tag is given in  
477 the data field.<sup>4</sup>

478 **Command Syntax**

<b>CLA</b>	'00' or '0C' for secure messaging
<b>INS</b>	'CB'
<b>P1</b>	'3F'
<b>P2</b>	'FF'
<b>L<sub>c</sub></b>	Length of data field*
<b>Data Field</b>	See Table 6
<b>L<sub>e</sub></b>	Number of data content bytes to be retrieved.

479 \* The L<sub>c</sub> value is '05' for all PIV data objects except for the 0x7E interindustry tag (Discovery Object) and  
480 the application property template (APT), which have an L<sub>c</sub> value of '03'.  
481

482 **Table 6. Data Objects in the Data Field of the GET DATA Card Command**

Name	Tag	M/O	Comment
Tag list	'5C'	M	BER-TLV tag of the data object to be retrieved. See Table 3, Part 1.

483 **Response Syntax**  
484

485 For the 0x7E Discovery Object (if present):

<b>Data Field</b>	BER-TLV of the 0x7E Discovery data object (see Section 3.3.2, Part 1 for a description of the Discovery Object's structure returned in the data field).
<b>SW1-SW2</b>	Status word

486 For all other PIV data objects:  
487

<b>Data Field</b>	BER-TLV with the tag '53' containing in the value field of the requested data object.
<b>SW1-SW2</b>	Status word

488

SW1	SW2	Meaning
'61'	'xx'	Successful execution where SW2 encodes the number of response data bytes still available
'69'	'82'	Security status not satisfied
'6A'	'82'	Data object not found
'90'	'00'	Successful execution

<sup>4</sup> The GET RESPONSE command is used in conjunction with GET DATA to accomplish the reading of larger PIV data objects. The GET RESPONSE command is illustrated in Appendix A.4.1 (Command 3).

**489 3.2 PIV Card Application Card Commands for Authentication****490 3.2.1 VERIFY Card Command**

491 The VERIFY card command initiates the comparison in the card of the reference data indicated by the  
492 key reference with authentication data in the data field of the command.

493 Key reference '80' specific to the PIV Card Application (i.e., local key references) and, optionally, the  
494 Global PIN with key reference '00', the OCC data (key references '96' and '97'), and pairing code (key  
495 reference '98') are the only key references that may be verified by the PIV Card Application's VERIFY  
496 command.

497 Key reference '80' shall be able to be verified by the PIV Card Application VERIFY command.

498 If the PIV Card Application contains the Discovery Object as described in Part 1, and the first byte of the  
499 PIN Usage Policy value is 0x60 or 0x70, then key reference '00' shall be able to be verified by the PIV  
500 Card Application VERIFY command.

501 If the PIV Card Application contains the Discovery Object as described in Part 1 and the first byte of PIN  
502 Usage Policy is 0x50 or 0x70, then key reference '98' shall be able to be verified by the PIV Card  
503 Application VERIFY command.

504 If the PIV Card Application contains the Discovery Object as described in Part 1 and the Biometric  
505 Information Template (BIT) is present, then key references '96' and/or '97' shall be able to be verified by  
506 the PIV Card Application VERIFY command.

507 If the key reference is '00' or '80' and the VERIFY command is not submitted over either the contact  
508 interface or the VCI, or if the key reference is '96', '97', or '98', and the VERIFY command is submitted  
509 over the contactless interface without secure messaging, then the card command shall fail, and the PIV  
510 Card Application shall return the status word '6A 81'. The security status and the retry counter of the key  
511 reference shall remain unchanged.

512 If the current value of the retry counter associated with the key reference is zero, then the comparison  
513 shall not be made, and the PIV Card Application shall return the status word '69 83'.

514 If the key reference is '00', '80', or '98', and the authentication data in the command data field does not  
515 satisfy the criteria in Section 2.4.3, then the card command shall fail, and the PIV Card Application shall  
516 return the status word '6A 80'. The security status and the retry counter of the key reference shall remain  
517 unchanged.

518 If the key reference is '96' or '97' and the authentication data in the command data field is not of length  
519 3N, where N satisfies the requirements for minimum and maximum number of minutiae specified in the  
520 BIT, then the card command shall fail, and the PIV Card Application shall return the status word '6A 80'.  
521 The security status and the retry counter of the key reference shall remain unchanged.

522 If the authentication data in the command data field does not match reference data associated with the key  
523 reference, then the card command shall fail. If the card command fails, the security status of the key  
524 reference shall be set to FALSE and the retry counter associated with the key reference shall be  
525 decremented by one.

526 If the card command succeeds, then the security status of the key reference shall be set to TRUE and the  
 527 retry counter associated with the key reference shall be set to the reset retry value associated with the key  
 528 reference. The initial value of the retry counter and the reset retry value associated with the key  
 529 reference, i.e., the number of successive failures (retries) before the retry counter associated with the key  
 530 reference reaches zero, are issuer dependent.

531 The VERIFY command shall reset the security status of the key reference in P2, when the P1 parameter is  
 532 'FF' and both L<sub>c</sub> and the data field are absent. The security status of the key reference specified in P2  
 533 shall be set to FALSE and the retry counter associated with the key reference shall remain unchanged.

### 534 Command Syntax

<b>CLA</b>	'00' or '10' indicating command chaining '0C' or '1C' for secure messaging
<b>INS</b>	'20'
<b>P1</b>	'00' or 'FF'
<b>P2</b>	Key reference. See Part 1, Table 4.
<b>L<sub>c</sub></b>	Absent <sup>5</sup> – for absent command data field '08' – for PIV Card Application PIN, Global PIN, or pairing code 3N – for OCC data (where N is the number of minutiae)
<b>Data Field</b>	Absent <sup>5</sup> , PIV Card Application PIN, Global PIN, or pairing code reference data as described in Section 2.4.3, or OCC data as described in Table 9 of SP 800-76-2.
<b>L<sub>e</sub></b>	Absent

535  
 536  
 537

### Response Syntax

<b>SW1</b>	<b>SW2</b>	<b>Meaning</b>
'63'	'CX'	Verification failed, X indicates the number of further allowed retries
'69'	'83'	Authentication method blocked
'6A'	'80'	Incorrect parameter in command data field
'6A'	'81'	Function not supported
'6A'	'88'	Key reference not found
'90'	'00'	Successful execution

538  
 539

<sup>5</sup> If P1='00', and L<sub>c</sub> and the command data field are absent, the command can be used to retrieve the number of further retries allowed ('63 CX'), or to check whether verification is not needed ('90 00').

540 **3.2.2 CHANGE REFERENCE DATA Card Command**

541 The CHANGE REFERENCE DATA card command initiates the comparison of the verification data with  
542 the current value of the reference data and if this comparison is successful, replaces the reference data  
543 with new reference data.

544 Only reference data associated with key references '80' and '81' specific to the PIV Card Application (i.e.,  
545 local key reference) and the Global PIN with key reference '00' may be changed by the PIV Card  
546 Application CHANGE REFERENCE DATA command. If any other key reference value is specified the  
547 PIV Card Application shall return the status word '6A 81'.

548 If the CHANGE REFERENCE DATA command is not submitted over either the contact interface or the  
549 VCI, then the card command shall fail, and the PIV Card Application shall return the status word '6A 81'.  
550 The security status and the retry counter of the key reference shall remain unchanged.

551 Key reference '80' reference data shall be changed by the PIV Card Application CHANGE REFERENCE  
552 DATA command. The ability to change reference data associated with key references '81' and '00' using  
553 the PIV Card Application CHANGE REFERENCE DATA command is optional.

554 If either the current reference data or the new reference data in the command data field of the command  
555 does not satisfy the criteria in Section 2.4.3, the PIV Card Application shall not change the reference data  
556 associated with the key reference and shall return the status word '6A 80', and retry counter shall remain  
557 unchanged.

558 If the current value of the retry counter associated with the key reference is zero, then the reference data  
559 associated with the key reference shall not be changed and the PIV Card Application shall return the  
560 status word '69 83'.

561 If the card command succeeds, then the security status of the key reference shall be set to TRUE and the  
562 retry counter associated with the key reference shall be set to the reset retry value associated with the key  
563 reference.

564 If the card command fails, then the security status of the key reference shall be set to FALSE and the retry  
565 counter associated with the key reference shall be decremented by one.

566 The initial value of the retry counter and the reset retry value associated with the key reference, i.e., the  
567 number of successive failures (retries) before the retry counter associated with the key reference reaches  
568 zero, is issuer dependent.

569 **Command Syntax**

<b>CLA</b>	'00' or '0C' for secure messaging
<b>INS</b>	'24'
<b>P1</b>	'00'
<b>P2</b>	'00' (Global PIN), '80' (PIV Card Application PIN), or '81' (PUK)
<b>L<sub>c</sub></b>	'10'
<b>Data Field</b>	Current PIN reference data concatenated without delimitation with the new PIN reference data, both PINs as described in Section 2.4.3
<b>L<sub>e</sub></b>	Absent

570

571 **Response Syntax**

SW1	SW2	Meaning
'63'	'CX'	Reference data change failed, X indicates the number of further allowed retries or resets
'69'	'83'	Reference data change operation blocked
'6A'	'80'	Incorrect parameter in command data field
'6A'	'81'	Function not supported
'6A'	'88'	Key reference not found
'90'	'00'	Successful execution

572

573

**3.2.3 RESET RETRY COUNTER Card Command**

574 The RESET RETRY COUNTER card command resets the retry counter of the PIN to its initial value and  
575 changes the reference data. The command enables recovery of the PIV Card Application PIN in the case  
576 that the cardholder has forgotten the PIV Card Application PIN.

577 The only key reference allowed in the P2 parameter of the RESET RETRY COUNTER command is the  
578 PIV Card Application PIN. Any other key references in P2 shall not be permitted and the PIV Card  
579 Application shall return the status word '6A 81'.

580 If the reset retry counter reference data (PUK) or the new reference data (PIN) in the command data field  
581 of the command does not satisfy the criteria in Section 2.4.3, the PIV Card Application shall not reset the  
582 retry counter associated with the PIN and shall return the status word '6A 80'. The PUK's retry counter  
583 shall remain unchanged.

584 If the current value of the PUK's retry counter is zero, then the PIN's retry counter shall not be reset, and  
585 the PIV Card Application shall return the status word '69 83'.

586 If the card command succeeds, then the PIN's retry counter shall be set to its reset retry value.  
587 Optionally, the PUK's retry counter may be set to its initial reset retry value. The security status of the  
588 PIN's key reference shall not be changed.

589 If the card command fails, then the security status of the PIN's key reference shall be set to FALSE, and  
590 the PUK's retry counter shall be decremented by one.

591 The initial retry counter associated with the PUK, i.e., the number of failures of the RESET RETRY  
592 COUNTER command before the PUK's retry counter reaches zero, is issuer dependent.

593 **Command Syntax**

<b>CLA</b>	'00'
<b>INS</b>	'2C'
<b>P1</b>	'00'
<b>P2</b>	'80' (PIV Card Application PIN).
<b>L<sub>c</sub></b>	'10'
<b>Data Field</b>	Reset retry counter reference data (PUK) concatenated without delimitation with the new reference data (PIN) (both PUK and PIN as described in Section 2.4.3)
<b>L<sub>e</sub></b>	Absent

594 **Response Syntax**

SW1	SW2	Meaning
'63'	'CX'	Reset failed, X indicates the number of further allowed resets
'69'	'83'	Reset operation blocked
'6A'	'80'	Incorrect parameter in command data field
'6A'	'81'	Function not supported
'6A'	'88'	Key reference not found
'90'	'00'	Successful execution

595

596

**3.2.4 GENERAL AUTHENTICATE Card Command**

597 The GENERAL AUTHENTICATE card command performs a cryptographic operation, such as an  
598 authentication protocol, using the data provided in the data field of the command and returns the result of  
599 the cryptographic operation in the response data field.<sup>6</sup>

600 The GENERAL AUTHENTICATE command shall be used with the PIV authentication keys ('9A', '9B',  
601 '9E') to authenticate the card or a card application to the client application (INTERNAL  
602 AUTHENTICATE), to authenticate an entity to the card (EXTERNAL AUTHENTICATE), and to  
603 perform a mutual authentication between the card and an entity external to the card (MUTUAL  
604 AUTHENTICATE).

605 The GENERAL AUTHENTICATE command shall be used with the digital signature key ('9C') to realize  
606 the signing functionality on the PIV client application programming interface. Data to be signed is  
607 expected to be hashed off card. Appendix A.4 illustrates the use of the GENERAL AUTHENTICATE  
608 command for signature generation.

609 The GENERAL AUTHENTICATE command shall be used with the key management key ('9D') and the  
610 retired key management keys ('82' – '95') to realize key establishment schemes specified in SP 800-78  
611 (ECDH and RSA). Appendix A.5 illustrates the use of the GENERAL AUTHENTICATE command for  
612 key establishment schemes aided by the PIV Card Application.

613 The GENERAL AUTHENTICATE command shall be used with the PIV Secure Messaging key ('03')  
614 and cryptographic algorithm identifier '27' or '2B' to establish session keys for secure messaging as  
615 specified in Section 4. If key reference '03' is specified in P2 then algorithm identifiers in P1 other than  
616 '27' and '2B' shall not be permitted and the PIV Card Application shall return the status word '6A 86'.

617 The GENERAL AUTHENTICATE command supports command chaining to permit the uninterrupted  
618 transmission of long command data fields to the PIV Card Application. If a card command other than the  
619 GENERAL AUTHENTICATE command is received by the PIV Card Application before the  
620 termination of a GENERAL AUTHENTICATE chain, the PIV Card Application shall rollback to the  
621 state it was in immediately prior to the reception of the first command in the interrupted chain. In other  
622 words, an interrupted GENERAL AUTHENTICATE chain has no effect on the PIV Card Application.

623

<sup>6</sup> For cryptographic operations with larger keys, e.g., RSA 2048, the GET RESPONSE command is used to return the complete result of the cryptographic operation. The GET RESPONSE command is illustrated in Appendix A.4.1 (Command 3).

624 **Command Syntax**

<b>CLA</b>	'00' or '10' indicating command chaining '0C' or '1C' for secure messaging
<b>INS</b>	'87'
<b>P1</b>	Algorithm reference. See Table 13 and [SP800-78, Table 6-2]
<b>P2</b>	Key reference. See Table 4, Part 1 for key reference values
<b>L<sub>c</sub></b>	Length of data field
<b>Data Field</b>	See Table 7
<b>L<sub>e</sub></b>	Absent or length of expected response

625

626

**Table 7. Data Objects in the Dynamic Authentication Template (Tag '7C')**

<b>Name</b>	<b>Tag</b>	<b>M/O</b>	<b>Description</b>
Witness	'80'	C	Demonstration of knowledge of a fact without revealing the fact. An empty witness is a request for a witness.
Challenge	'81'	C	One or more random numbers or byte sequences to be used in the authentication protocol.
Response	'82'	C	A sequence of bytes encoding a response step in an authentication protocol.
Exponentiation	'85'	C	A parameter used in ECDH key agreement protocol.

627

628 The data objects that appear in the dynamic authentication template (tag '7C') in the data field of the  
629 GENERAL AUTHENTICATE card command depend on the authentication protocol being executed.  
630 The Witness (tag '80') contains encrypted data (unrevealed fact). This data is decrypted by the card. The  
631 Challenge (tag '81') contains clear data (byte sequence), which is encrypted by the card. The Response  
632 (tag '82') contains either the decrypted data from tag '80' or the encrypted data from tag '81'. Note that the  
633 empty tags (i.e., tags with no data) return the same tag with content (they can be seen as “requests for  
634 requests”):

635 + '80 00' Returns '80 TL <encrypted random>' (as per definition)

636 + '81 00' Returns '81 TL <random>' (as per external authenticate example)

637 **Response Syntax**

<b>Data Field</b>	Absent, authentication-related data, signed data, shared secret, or transported key
<b>SW1-SW2</b>	Status word

638

639

<b>SW1</b>	<b>SW2</b>	<b>Meaning</b>
'61'	'xx'	Successful execution where SW2 encodes the number of response data bytes still available
'69'	'82'	Security status not satisfied
'6A'	'80'	Incorrect parameter in command data field
'6A'	'86'	Incorrect parameter in P1 or P2
'90'	'00'	Successful execution

640 **3.3 PIV Card Application Card Commands for Credential Initialization and**  
641 **Administration**

642 **3.3.1 PUT DATA Card Command**

643 The PUT DATA card command completely replaces the data content of a single data object in the PIV  
644 Card Application with new content.

645 **Command Syntax**

<b>CLA</b>	'00' or '10' indicating command chaining
<b>INS</b>	'DB'
<b>P1</b>	'3F'
<b>P2</b>	'FF'
<b>L<sub>c</sub></b>	Length of data field
<b>Data Field</b>	See Tables 8 and 9
<b>L<sub>e</sub></b>	Absent

646

647 For the 0x7E Discovery Object (if present):

648

**Table 8. Data Field of the PUT DATA Card Command for the Discovery Object**

Tag	M/O	Description
'7E'	M	BER-TLV of tag '7E' as illustrated in Section 3.3.2, Part 1.

649

650 For all other PIV Data objects:

651

**Table 9. Data Field of the PUT DATA Card Command for all other PIV Data Objects**

Name	Tag	M/O	Description
Tag list	'5C'	M	Tag of the data object whose data content is to be replaced. See Table 3, Part 1.
Data	'53'	M	Data with tag '53' as an unstructured byte sequence.

652

653

654 **Response Syntax**

<b>Data Field</b>	Absent
<b>SW1-SW2</b>	Status word

655

SW1	SW2	Meaning
'69'	'82'	Security status not satisfied
'6A'	'81'	Function not supported
'6A'	'84'	Not enough memory
'90'	'00'	Successful execution

656 **3.3.2 GENERATE ASYMMETRIC KEY PAIR Card Command**

657 The GENERATE ASYMMETRIC KEY PAIR card command initiates the generation and storing in the  
 658 card of the reference data of an asymmetric key pair, i.e., a public key and a private key. The public key  
 659 of the generated key pair is returned as the response to the command. If there is reference data currently  
 660 associated with the key reference, it is replaced in full by the generated data.

661 **Command Syntax**

<b>CLA</b>	'00' or '10' indicating command chaining
<b>INS</b>	'47'
<b>P1</b>	'00'
<b>P2</b>	Key reference. See Table 4 of Part 1 for a list of the key references
<b>L<sub>c</sub></b>	Length of data field
<b>Data Field</b>	Control reference template. See Table 10
<b>L<sub>e</sub></b>	Length of public key of data object template

662 **Table 10. Data Objects in the Template (Tag 'AC')**

Name	Tag	M/O	Description
Cryptographic mechanism identifier	'80'	M	See Part 1, Table 5
Parameter	'81'	C	Specific to the cryptographic mechanism

663

664 **Response Syntax**

<b>Data Field</b>	Data objects of public key of generated key pair. See Table 11
<b>SW1-SW2</b>	Status word

665 **Table 11. Data Objects in the Template (Tag '7F49')**

Name	Tag
<b>Public key data objects for RSA</b>	
Modulus	'81'
Public exponent	'82'
<b>Public key data objects for ECDSA</b>	
Point	'86'

666

667 The public key data object in tag '86' is encoded as follows:

668 **Table 12. Public Key encoding for ECDSA**

Tag	Length	Value
'86'	L	04    X    Y [SECG, Section 2.3.3]

669

670 Note: The octet '04' indicates that the X and Y coordinates of point P are encoded without the use of  
671 point compression. The length L is 65 bytes for points on Curve P-256 and 97 bytes for points on Curve  
672 P-384.

SW1	SW2	Meaning
'61'	'xx'	Successful execution where SW2 encodes the number of response data bytes still available
'69'	'82'	Security status not satisfied
'6A'	'80'	Incorrect parameter in command data field; e.g. unrecognized cryptographic mechanism
'6A'	'81'	Function not supported
'6A'	'86'	Incorrect parameter P2; cryptographic mechanism of reference data to be generated different than cryptographic mechanism of reference data of given key reference
'90'	'00'	Successful execution

673

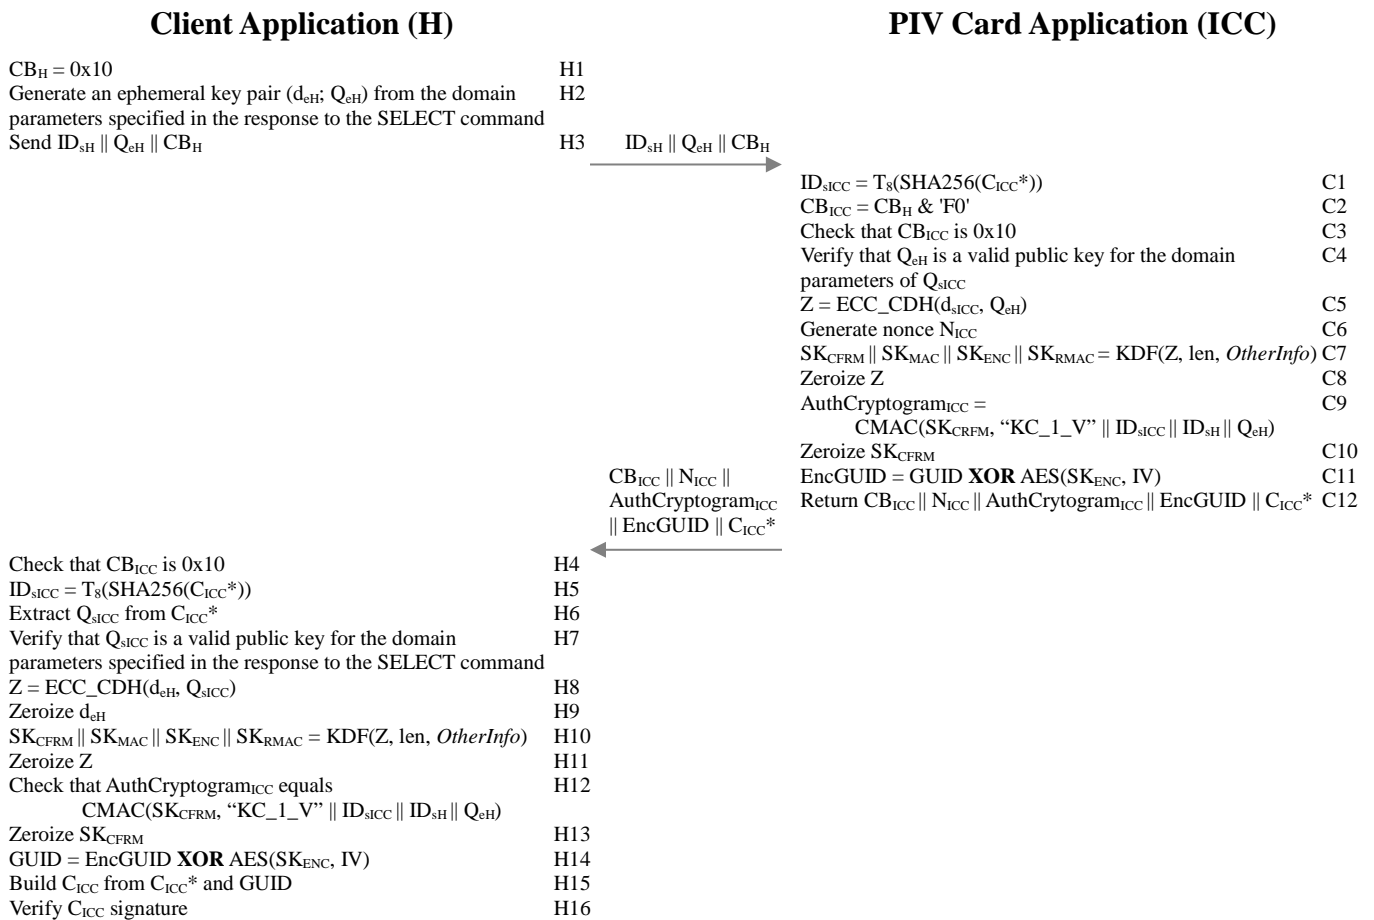

674 **4. Secure Messaging**

675 If a PIV Card Application implements the optional secure messaging protocol, it shall be implemented as  
 676 specified in this section. Secure messaging is initiated through the use of a key establishment protocol.  
 677 The key establishment protocol defined here is a one-way authentication protocol that authenticates the  
 678 PIV Card Application to the client applicant and establishes a set of session keys that may be  
 679 subsequently used to protect the communication channel between the two parties.

680 Section 4.1 describes the key establishment protocol used to support secure messaging in the PIV Card  
 681 Application. Section 4.2 describes the use of secure messaging to protect commands and responses sent  
 682 between the client application and the PIV Card Application.

683 **4.1 The Key Establishment Protocol**

684 The key establishment protocol for the PIV Card Application is based on a simplified profile of  
 685 OPACITY with Zero Key Management [ANSI504-1], as depicted below.

686  
 687 Sections 4.1.1 and 4.1.2 provide additional details about each of the protocol steps performed by the client  
 688 application and the PIV Card Application, and Section 4.1.3 defines the notations used in the description  
 689 of the protocol. Section 4.1.4 provides the details of the two cipher suites that may be supported by the  
 690 PIV Card Application. Section 4.1.5 specifies the format for the card verifiable certificate (CVC) that is  
 691 used to authenticate the PIV Card Application. Section 4.1.6 provides additional information about the

692 key derivation function (KDF) used to derive the session keys that are used during secure messaging, and  
 693 Section 4.1.7 provides additional information about the computation of the authentication cryptogram for  
 694 key confirmation. Section 4.1.8 demonstrates the use of the GENERAL AUTHENTICATE to perform  
 695 the key establishment protocol.

#### 696 4.1.1 Client Application Steps

Step #	Description	Comment
H1	Set $CB_H$ to 0x10	The client application's control byte is set to 0x10 to indicate the client application does not support persistent binding, wants the GUID returned in encrypted form, and wants 3 session keys to be generated.
H2	Generate an ephemeral key pair ( $d_{eH}$ ; $Q_{eH}$ )	Generate an ephemeral ECC key pair for the client application. If the 0xAC tag of the application property template (APT) includes '27' then generate an ephemeral key pair over Curve P-256. If the 0xAC tag of the APT includes '2B' then generate an ephemeral key pair over Curve P-384.
H3	Send $ID_{sH} \parallel Q_{eH} \parallel CB_H$	
Wait for response from PIV Card Application: $CB_{ICC} \parallel N_{ICC} \parallel AuthCryptogram_{ICC} \parallel EncGUID \parallel C_{ICC}^*$		
H4	Check that $CB_{ICC}$ is 0x10	Verify that the card executed the protocol in accordance with the parameters specified in Step H1.
H5	$ID_{sICC} = T_8(\text{SHA256}(C_{ICC}^*))$	$ID_{sICC}$ , the left-most 8 bytes of the SHA-256 hash of $C_{ICC}^*$ , is used as an input for session key derivation.
H6	Extract $Q_{sICC}$ from $C_{ICC}^*$	$C_{ICC}^*$ is a transformation of the PIV Card's CVC, $C_{ICC}$ (see Section 4.1.5). $C_{ICC}^*$ is constructed from $C_{ICC}$ by replacing the Subject Identifier of $C_{ICC}$ ( $T=0x5F20$ , $L=16$ , $V=GUID$ ) with ( $T=0x5F20$ , $L=0$ ), and leaving all other fields of the CVC unchanged, including the DigitalSignature object.
H7	Verify that $Q_{sICC}$ is a valid public key for the domain parameters specified in the response to the SELECT command	Perform public key validation of $Q_{sICC}$ , where the domain parameters are those of Curve P-256 if P1 is '27' and those of Curve P-384 if P1 is '2B'.
H8	$Z = \text{ECC\_CDH}(d_{eH}, Q_{sICC})$	Compute the shared secret, Z, using the ECC CDH primitive [SP800-56A, Section 5.7.1.2].
H9	Zeroize $d_{eH}$	Destroy the ephemeral private key generated in Step H2.
H10	$SK_{CFRM} \parallel SK_{MAC} \parallel SK_{ENC} \parallel SK_{RMAC} =$ $\text{KDF}(Z, \text{len}, \text{OtherInfo})$	Compute the key confirmation key and the session keys. See Section 4.1.6.
H11	Zeroize Z	Destroy the shared secret generated in Step H8.

Step #	Description	Comment
H12	Check that $\text{AuthCryptogram}_{\text{ICC}}$ equals $\text{CMAC}(\text{SK}_{\text{CFRM}}, \text{"KC\_1\_V"} \parallel \text{ID}_{\text{SICC}} \parallel \text{ID}_{\text{SH}} \parallel \text{Q}_{\text{eH}})$	Perform key confirmation by verifying the authentication cryptogram as described in Section 4.1.7. Return authentication error if verification fails.
H13	Zeroize $\text{SK}_{\text{CFRM}}$	Destroy the key confirmation key derived in Step H10.
H14	$\text{GUID} = \text{EncGUID} \text{ XOR } \text{AES}(\text{SK}_{\text{ENC}}, \text{IV})$	Decrypt GUID. IV is a 16-byte constant consisting of '80' followed by 15 bytes of '00'.
H15	Build $\text{C}_{\text{ICC}}$ from $\text{C}_{\text{ICC}}^*$ and GUID	Replace the empty Subject Identifier (T=0x5F20, L=0) in $\text{C}_{\text{ICC}}^*$ with (T=0x5F20, L=16, V=GUID) to create $\text{C}_{\text{ICC}}$ .
H16	Verify $\text{C}_{\text{ICC}}$ signature	Verify signature on $\text{C}_{\text{ICC}}$ and, using standards-compliant PKI path validation, validate the content signing certificate needed to verify the signature on $\text{C}_{\text{ICC}}$ . Return authentication error if verification fails.

697  
698

#### 4.1.2 PIV Card Application Protocol Steps

Step #	Description	Comment
C1	$\text{ID}_{\text{SICC}} = \text{T}_8(\text{SHA256}(\text{C}_{\text{ICC}}^*))$	$\text{ID}_{\text{SICC}}$ , the left-most 8 bytes of the SHA-256 hash of $\text{C}_{\text{ICC}}^*$ is used as an input for session key derivation. See Step H6 for construction of $\text{C}_{\text{ICC}}^*$ (Note that $\text{ID}_{\text{SICC}}$ and $\text{C}_{\text{ICC}}^*$ are static, and so may be pre-computed off card.)
C2	$\text{CB}_{\text{ICC}} = \text{CB}_{\text{H}} \text{ \& } \text{'F0'}$	Create the PIV Card Application's control byte from client application's control byte, indicating that persistent binding has not been used in this transaction, even if $\text{CB}_{\text{H}}$ indicates that the client application supports it. This may be done by setting $\text{CB}_{\text{ICC}}$ to the value of $\text{CB}_{\text{H}}$ and then setting the 4 least significant bits of $\text{CB}_{\text{ICC}}$ to 0.
C3	Check that $\text{CB}_{\text{ICC}}$ is 0x10	Check that client application is requesting that the GUID be returned in encrypted form and that 3 session keys be generated.
C4	Verify that $\text{Q}_{\text{eH}}$ is a valid public key for the domain parameters of $\text{Q}_{\text{SICC}}$	Perform public key validity of $\text{Q}_{\text{eH}}$ , where the domain parameters are those of $\text{Q}_{\text{SICC}}$ . Also verify that P1 is '27' if the domain parameters of $\text{Q}_{\text{SICC}}$ are those of Curve P-256 or that P1 is '2B' if the domain parameters of $\text{Q}_{\text{SICC}}$ are those of Curve P-384.

Step #	Description	Comment
C5	$Z = \text{ECC\_CDH}(d_{sICC}, Q_{eH})$	Compute the shared secret, Z, using the ECC CDH primitive [SP800-56A, Section 5.7.1.2].
C6	Generate nonce $N_{ICC}$	Create a random nonce, where the length is as specified in Table 13.
C7	$SK_{CFRM} \parallel SK_{MAC} \parallel SK_{ENC} \parallel SK_{RMAC} =$ $\text{KDF}(Z, \text{len}, \text{OtherInfo})$	Compute the key confirmation key and the session keys. See Section 4.1.6.
C8	Zeroize Z	Destroy shared secret generated in Step C5.
C9	$\text{AuthCryptogram}_{ICC} =$ $\text{CMAC}(SK_{CFRM}, "KC\_1\_V" \parallel ID_{sICC} \parallel ID_{sH} \parallel Q_{eH})$	Compute the authentication cryptogram for key confirmation as described in Section 4.1.7.
C10	Zeroize $SK_{CFRM}$	Destroy the key confirmation key derived in Step C7.
C11	$\text{EncGUID} = \text{GUID XOR AES}(SK_{ENC}, IV)$	Encrypt GUID, which is the Subject Identifier of $C_{ICC}$ , the PIV Card's CVC. IV is a 16-byte constant consisting of '80' followed by 15 bytes of '00'.
C12	Return $CB_{ICC} \parallel N_{ICC} \parallel \text{AuthCryptogram}_{ICC} \parallel$ $\text{EncGUID} \parallel C_{ICC}^*$	

699  
700

### 4.1.3 Notations

Name	Comment	Format	Size (in bytes)
$ICC$	Integrated Circuit Card (PIV Card)	N/A	N/A
$ID_{sICC}$	Static, non-anonymous PIV Card identifier, which is the truncated hash of $C_{ICC}^*$	Binary	8 bytes
$GUID$	Card UUID (see Section 3.4.1 of Part 1)	Binary	16 bytes
$CVC$ or $C_{ICC}$	Card verifiable certificate, which is authenticated by client application. See Section 4.1.5.	CVC	
$C_{ICC}^*$	Confidential card verifiable certificate for privacy, derived from $C_{ICC}$ as follows: The Subject Identifier data element of $C_{ICC}$ (T=0x5F20, L=16, V=GUID) is replaced with (T=0x5F20, L=0). All other data elements, including the DigitalSignature object, and their order are identical to those in $C_{ICC}$ .	CVC	
$ID_{sH}$	Client application identifier. This is a locally assigned identifier for the client application. If none is available, it could be set to all zeros.	Binary	8 bytes
$N_{ICC}$	PIV Card Application nonce. See Table 13 for the length.	Binary	16 or 24 bytes
$SK_{CFRM}$	Key confirmation key used to compute authentication cryptogram.		16 or 32 bytes
$SK_{MAC}, SK_{RMAC},$ $SK_{ENC}$	Secure messaging session keys. See Table 13 for encryption or MAC session key length.		16 or 32 bytes
$T_8(Data)$	Leftmost 8 bytes of $Data$ .	Binary	8 bytes
$T_{16}(Data)$	Leftmost 16 bytes of $Data$ .	Binary	16 bytes
$\text{KDF}(Z, \text{len},$ $\text{OtherInfo})$	Key Derivation Function (KDF) specified in Section 4.1.6.	N/A	N/A

Name	Comment	Format	Size (in bytes)
<i>ECC_CDH</i>	Elliptic curve cryptography cofactor Diffie-Hellman (ECC CDH) primitive, as specified in [SP800-56A, Section 5.7.1.2].	N/A	N/A
<i>OtherInfo</i>	Input parameters to the KDF function. See Section 4.1.6.	N/A	N/A
<i>len</i>	The length (in bits) of the secret keying material to be generated using the KDF ( <i>len</i> = 512 for cipher suite 2 and 1024 for cipher suite 4).	N/A	N/A
<i>CB<sub>ICC</sub></i>	Protocol control byte returned by the PIV Card	Binary	1 byte
<i>CB<sub>H</sub></i>	Protocol control byte sent by client application (host)	Binary	1 byte

701  
702

#### 4.1.4 Cipher Suite

703 This document specifies two cipher suites (see Table 13) that may be used for key establishment and  
 704 secure messaging, one that provides 128 bits of channel strength and one that provides 192 bits of channel  
 705 strength. If the PIV Card Application supports the VCI and either the digital signature key ('9C'), the key  
 706 management key ('9D'), or one of the retired key management keys ('82' – '95') is an ECC (Curve P-384)  
 707 key, then PIV Card Application shall only support cipher suite CS4. Otherwise, the PIV Card  
 708 Application may support either CS2 or CS4.

709

Table 13. Cipher Suite for PIV Secure Messaging

	128 bit channel strength	192 bit channel strength
Cipher Suite ID	CS2	CS4
Algorithm Identifier (P1)	'27'	'2B'
Key confirmation and session keys ( <i>SK<sub>CFRM</sub></i> , <i>SK<sub>MAC</sub></i> , <i>SK<sub>RMAC</sub></i> , <i>SK<sub>ENC</sub></i> )	AES 128	AES 256
<i>C<sub>ICC</sub></i> signature	ECDSA with SHA-256 using an ECDSA (Curve P-256) key	ECDSA with SHA-384 using an ECDSA (Curve P-384) key
<i>C<sub>ICC</sub></i> public key	ECDH (Curve P-256)	ECDH (Curve P-384)
KDF hash	SHA-256	SHA-384
Nonce ( <i>N<sub>ICC</sub></i> )	16 bytes	24 bytes

710  
711

#### 4.1.5 Card Verifiable Certificate

712 Table 14 specifies the format for the CVC, *C<sub>ICC</sub>*.

713 *C<sub>ICC</sub>* is used to authenticate the PIV Card Application. The specific data object tags and specified order  
 714 must be used to allow the CVC processing within authentication protocols. The specific data object tags  
 715 for *C<sub>ICC</sub>* are provided in Table 14.

716

Table 14. Card Verifiable Certificate Format

Tag	Tag	Tag	Length	Name	Value
0x7F21				Card Verifiable Certificate	
	0x5F29		1	Credential Profile Identifier	0x80
	0x42		8	Issuer Identification Number	The leftmost 8 bytes of the subjectKeyIdentifier in the content signing certificate needed to verify the signature on C <sub>ICC</sub> .
	0x5F20		16	Subject Identifier	GUID (Card UUID) [In C <sub>ICC</sub> *, the length of the Subject Identifier is 0.]
	0x7F49		Variable	CardHolderPublicKey Data Object	
		0x06	Variable	Algorithm OID	Possible values are: <ul style="list-style-type: none"> <li>▪ 0x2A8648CE3D030107 for ECDH (Curve P-256) or</li> <li>▪ 0x2B81040022 for ECDH (Curve P-384)</li> </ul>
		0x86	Variable	Public Key object	Coded as follows: 04    X    Y, where X and Y are the coordinates of the point on the curve. See the “Value” column of Table 12.
	0x5F4C		1	Role Identifier	0x00 for card-application key CVC
	0x5F37		Variable	DigitalSignature object	<p>DigitalSignature ::= SEQUENCE {  signatureAlgorithm AlgorithmIdentifier,  signatureValue BIT STRING  }</p> <p>AlgorithmIdentifier ::= SEQUENCE {  algorithm OBJECT IDENTIFIER,  parameters ANY DEFINED BY  algorithm OPTIONAL  }</p> <p>algorithm is 1.2.840.10045.4.3.2 for ECDSA with SHA-256 (cipher suite 2) and 1.2.840.10045.4.3.3 for ECDSA with SHA-384 (cipher suite 4). For both algorithms, the parameters field is absent.</p> <p>signatureValue is the DER encoding of signature result ECDSA-Sig-Value defined below.</p> <p>ECDSA-Sig-Value ::= SEQUENCE {  r INTEGER,  s INTEGER  }</p>

718 The signature of the CVC (DigitalSignature object) is calculated over the concatenation of the TLV  
719 encoded Credential Profile Identifier, Issuer Identification Number, Subject Identifier,  
720 CardHolderPublicKey Data Object, and Role Identifier, i.e., { '5F29' '01' '80' } || { '42' '08' IIN } || { '5F20'  
721 '10' GUID } || { '7F49' L1 { { '06' L2 OID } { '86' L3 '04' X Y } } } { '5F4C' '01' '00' }.

#### 722 4.1.6 Key Derivation

723 The session keys shall be derived in Steps C7 and H10 of the protocol using the key derivation function  
724 from [SP800-56A, Section 5.8.1], with the auxiliary function H being the hash function specified as the  
725 KDF hash in Table 13 and *OtherInfo* being constructed using the concatenation format as show below:

Cipher Suite ID	<i>OtherInfo</i>
CS2	0x04    0x09    0x09    0x09    0x09    0x08    ID <sub>sH</sub>    0x10    T <sub>16</sub> (Q <sub>eH</sub> )    0x08    ID <sub>sICC</sub>    0x10    N <sub>ICC</sub>
CS4	0x04    0x0D    0x0D    0x0D    0x0D    0x08    ID <sub>sH</sub>    0x10    T <sub>16</sub> (Q <sub>eH</sub> )    0x08    ID <sub>sICC</sub>    0x18    N <sub>ICC</sub>

726

#### 727 4.1.7 Key Confirmation

728 Key confirmation shall be performed in Steps C9 and H12 of the protocol in accordance with [SP800-  
729 56A] by the generation of AuthCryptogram<sub>ICC</sub>. AuthCryptogram<sub>ICC</sub> shall be computed as  
730 CMAC(*MacKey*, *MacLen*, *MacData<sub>p</sub>*), where *MacKey* is SK<sub>CFRM</sub>, *MacLen* is 128 bits, and *MacData<sub>p</sub>* is  
731 "KC\_1\_V" || ID<sub>sICC</sub> || ID<sub>sH</sub> || Q<sub>eH</sub>. For Q<sub>eH</sub>, the coordinates of the ephemeral public key are converted from  
732 field elements to byte strings as specified in [SP800-56A, Appendix C.2], Field-Element-to-Byte String  
733 Conversion, and concatenated (with *x* first) to form a single byte string. CMAC is cipher-based message  
734 authentication code from [SP800-38B], where the block cipher is AES.

#### 735 4.1.8 Command Interface

736 The following command interface shall be used for the key establishment protocol.

#### 737 Command Syntax

CLA	'00'
INS	'87'
P1	Algorithm reference ('27' or '2B'), as specified in the 0xAC tag of the application property template
P2	'03' (PIV Secure Messaging key).
L <sub>c</sub>	Length of data field
Data Field	'81' L1 { CB <sub>H</sub>    ID <sub>sH</sub>    Q <sub>eH</sub> } '82 00', where CB <sub>H</sub> is 0x10, ID <sub>sH</sub> is an 8-byte client application identifier as described in Section 4.1.3, and Q <sub>eH</sub> is an ephemeral public key encoded as 04    X    Y, as specified in the "Value" column of Table 12.
L <sub>e</sub>	Absent

738

#### 739 Response Syntax

Data Field	'82' LL { CB <sub>ICC</sub>    N <sub>ICC</sub>    AuthCryptogram <sub>ICC</sub>    EncGUID    C <sub>ICC</sub> * }
SW1-SW2	Status word

740

SW1	SW2	Meaning
'61'	'xx'	Successful execution where SW2 encodes the number of response data bytes still available
'6A'	'80'	Incorrect parameter in command data field
'6A'	'86'	Incorrect parameter in P1 or P2
'90'	'00'	Successful execution

741

742 **4.2 Secure Messaging**

743 PIV secure messaging is used to protect the integrity and confidentiality of the PIV data being transmitted  
 744 between the card and the relying system. PIV secure messaging shall be provided using symmetric  
 745 session keys derived using the key establishment protocol defined Section 4.1.

746 Once session keys are established and the card is authenticated as specified in Section 4.1, subsequent  
 747 communication with the card can be performed using secure messaging by setting bits b3 and b4 of the  
 748 CLA byte of the command APDU to 1, resulting in a '0C' or '1C' CLA byte. If bits b3 and b4 of the CLA  
 749 byte are set, then both the command and the response shall be encrypted and integrity protected as  
 750 described in this section. If the PIV Card Application cannot encrypt and integrity protect the response  
 751 (e.g., because it does not support secure messaging or no session keys have been established), the PIV  
 752 Card Application shall return an error (see Section 4.2.7). In the case of command chaining, if bits b3 and  
 753 b4 of the CLA are set in any command in the chain then they shall be set in every command in the chain.

754 When secure messaging is used, the data field of the card command (or response) is encrypted first and  
 755 then a message authentication code (MAC) is applied to the entire command (or response). When  
 756 command (or response) chaining is required, the encryption and MAC are applied to the entire message  
 757 and the result is then fragmented into separate command (or response) data fields.

758 In order to ensure that message reordering or replay attacks can be detected, a 16-byte MAC chaining  
 759 value (MCV) is used. For the first command, and for the first response, sent after successful completion  
 760 of the key establishment protocol the MCV consists of 16 bytes of '00'. For each subsequent command  
 761 the MCV is the 16-byte MAC value computed on the previous command, and for each subsequent  
 762 response the MCV is the 16-byte MAC value computed on the previous response. The MCV is included  
 763 as part of the message over which the MAC value for each command (or response) is computed.

764 The  $SK_{ENC}$  session key shall be used to encrypt the command data field and response data field as  
 765 described in Section 4.2.2. The  $SK_{MAC}$  session key shall be used to add integrity to the command as  
 766 described in Section 4.2.3. The  $SK_{RMAC}$  session key shall be used to add integrity to the response as  
 767 described in Section 4.2.5.

768 Secure messaging specified in this section can be applied to the following commands:

- 769 + GET DATA
- 770 + VERIFY
- 771 + CHANGE REFERENCE DATA
- 772 + GENERAL AUTHENTICATE

773 **4.2.1 Secure Messaging Data Objects**

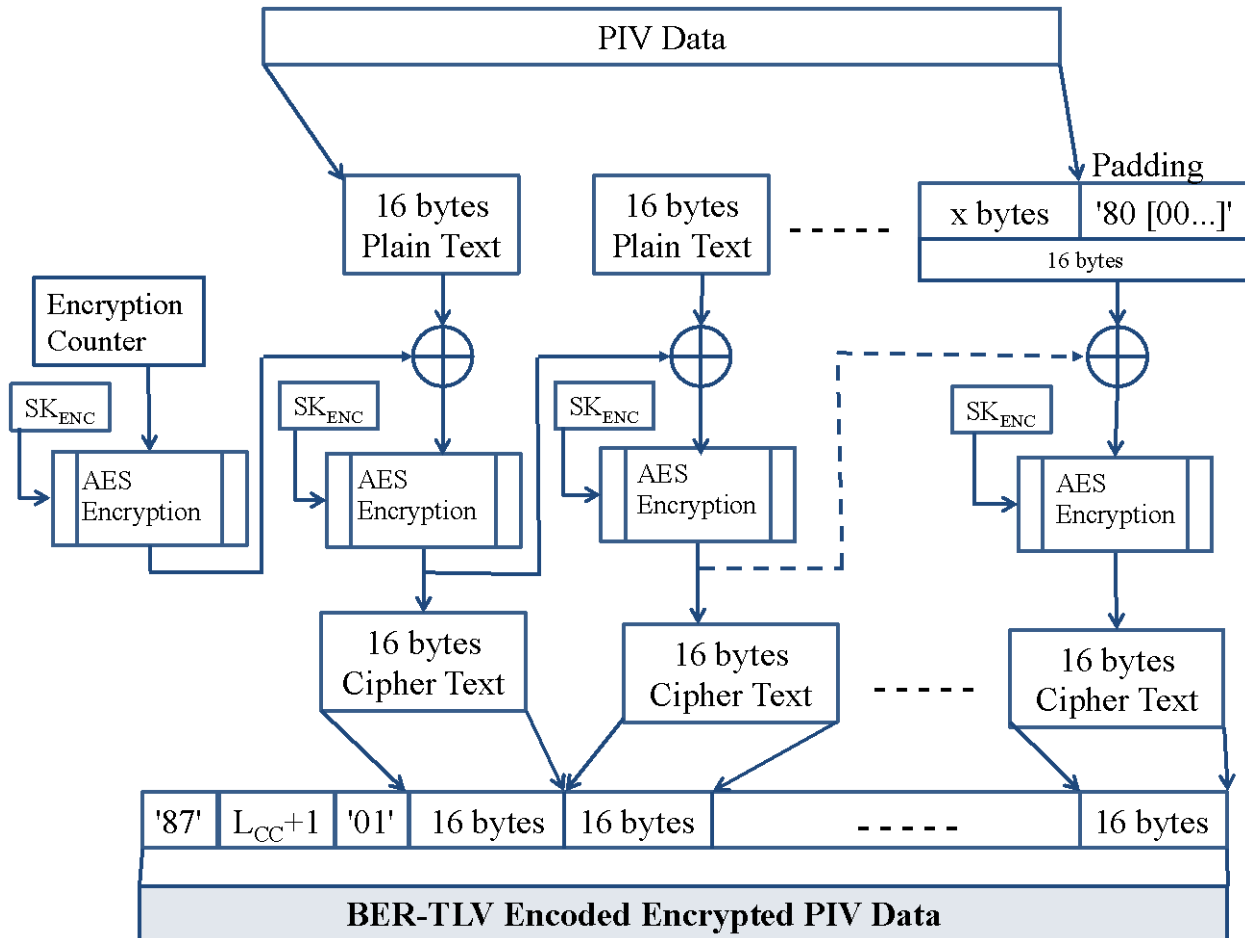

774 The command and response messages shall be BER-TLV encoded according to Table 15.

775 **Table 15. Secure Messaging Data Objects**

Tag	Description
'87'	Padding-content indicator byte followed by the encrypted data
'8E'	Cryptographic checksum (MAC)
'97'	$L_e$
'99'	Status word

776 **4.2.2 Command and Response Data Confidentiality**

778 Under secure messaging, the PIV data is encrypted using AES in Cipher Block Chaining (CBC) mode  
 779 with the  $SK_{ENC}$  session key, where  $SK_{ENC}$  is a 128-bit key for CS2 and a 256-bit key for CS4 as per Table  
 780 13. The encryption and encoding process for command data and response data shall be the same. The  
 781 encryption of the command data or response data and encoding in BER-TLV format is illustrated Figure  
 782 1. The encryption shall be computed over the entire message before applying fragmentation for data  
 783 transportation.

784 **Figure 1. PIV Data Confidentiality**

786 Initialization Vector (IV): The IV for the AES CBC encryption of command data shall be generated by  
 787 applying the AES block cipher to a 16-byte encryption counter. The initial value of the encryption  
 788 counter upon successful completion of the key establishment protocol shall be '00 00 00 00 00 00 00 00  
 789 00 00 00 00 00 00 01'. The encryption counter shall be incremented by one after each creation of an  
 790 IV to encrypt command data, and it shall be reset to its initial value after each successful completion of  
 791 the key establishment protocol. The 16-byte IV shall be created by encrypting the encryption counter  
 792 with  $SK_{ENC}$  using AES in the electronic codebook (ECB) mode of operation.

793 The IV for the AES CBC encryption of response data shall also be generated by encrypting an encryption  
 794 counter with  $SK_{ENC}$  using AES in the ECB mode of operation. The encryption counter value used to  
 795 generate the IV to encrypt the response data shall be the same as the encryption counter value used to  
 796 generate the IV to encrypt the corresponding request data, with the exception that the most significant  
 797 byte of the 16-byte counter shall be set to '80' (i.e., the IV used to encrypt the first response after  
 798 successful completion of the key establishment protocol shall be generated by encrypting '80 00 00 00 00  
 799 00 00 00 00 00 00 00 00 00 01' with  $SK_{ENC}$ ).

800 Padding: If the length of the command or response data is not a multiple of 16 bytes then padding shall  
 801 be added to the last block of input data. The padding shall be '80' followed by the number of zeros  
 802 needed to make up the length of 16 byte input block. If padding is used, the first byte of the value field of  
 803 tag '87' shall be '01'; otherwise, the first byte shall be '02'.

804 As illustrated in Figure 1, the input and output of encryption is as follows:

- 805 • **Encryption input:**
- 806 Plain Text
- 807 • **Encryption output:**
- 808 BER-TLV encoded encrypted message, which consists of tag '87' followed by the length
- 809 of the encoded encrypted message ( $L_{cc} + 1$ ), the padding indicator byte ('01' or '02'), and
- 810 then the encrypted data.  $L_{cc}$  is the length of the encrypted PIV data; it shall be a multiple
- 811 of 16.

### 812 4.2.3 Command Integrity

814 The Command MAC (C-MAC) shall be generated by applying the cipher-based MAC (CMAC)  
 815 [SP800-38B] to the header and data field of a command using the  $SK_{MAC}$  session key. In the case that  
 816 fragmentation is required for data transmission, the command shall be constructed without fragmentation  
 817 for the purposes of computing the MAC, and the CLA byte used in the computation of the MAC shall be  
 818 '0C'.

819 The data to be MACed,  $M_{C-MAC}$ , shall be constructed by concatenating the following:

- 820 1. The 16-byte MAC chaining value (MCV). For the first command sent after successful  
 821 completion of the key establishment protocol the MCV consists of 16 bytes of '00'. For each  
 822 subsequent command the MCV is the 16-byte MAC value computed for the previous command.
- 823 2. A 16-byte encoded header. The encoded header shall consist of the CLA byte ('0C'), the INS  
 824 byte, P1, and P2, followed by twelve bytes of padding, consisting of '80' followed eleven bytes of  
 825 '00'. (The length of the data field,  $L_c$ , is not included in the data to be MACed.)

- 826 3. The data field, which is the BER-TLV encoded encrypted message.<sup>7</sup>
- 827 4.  $L_e$  encapsulated in BER-TLV format with tag '97', if the  $L_e$  field is included in the command.
- 828 Let  $T_{C-MAC} = CMAC(SK_{MAC}, M_{C-MAC})$  as described in [SP800-38B]. The BER-TLV encoded C-MAC for  
 829 the command shall be the 8 most significant bytes of  $T_{C-MAC}$  encapsulated in BER-TLV format with tag  
 830 '8E'. The entire 16-byte value  $T_{C-MAC}$  will be the MCV for the next command.
- 831 Figure 2 below illustrates how the C-MAC is generated for each command.

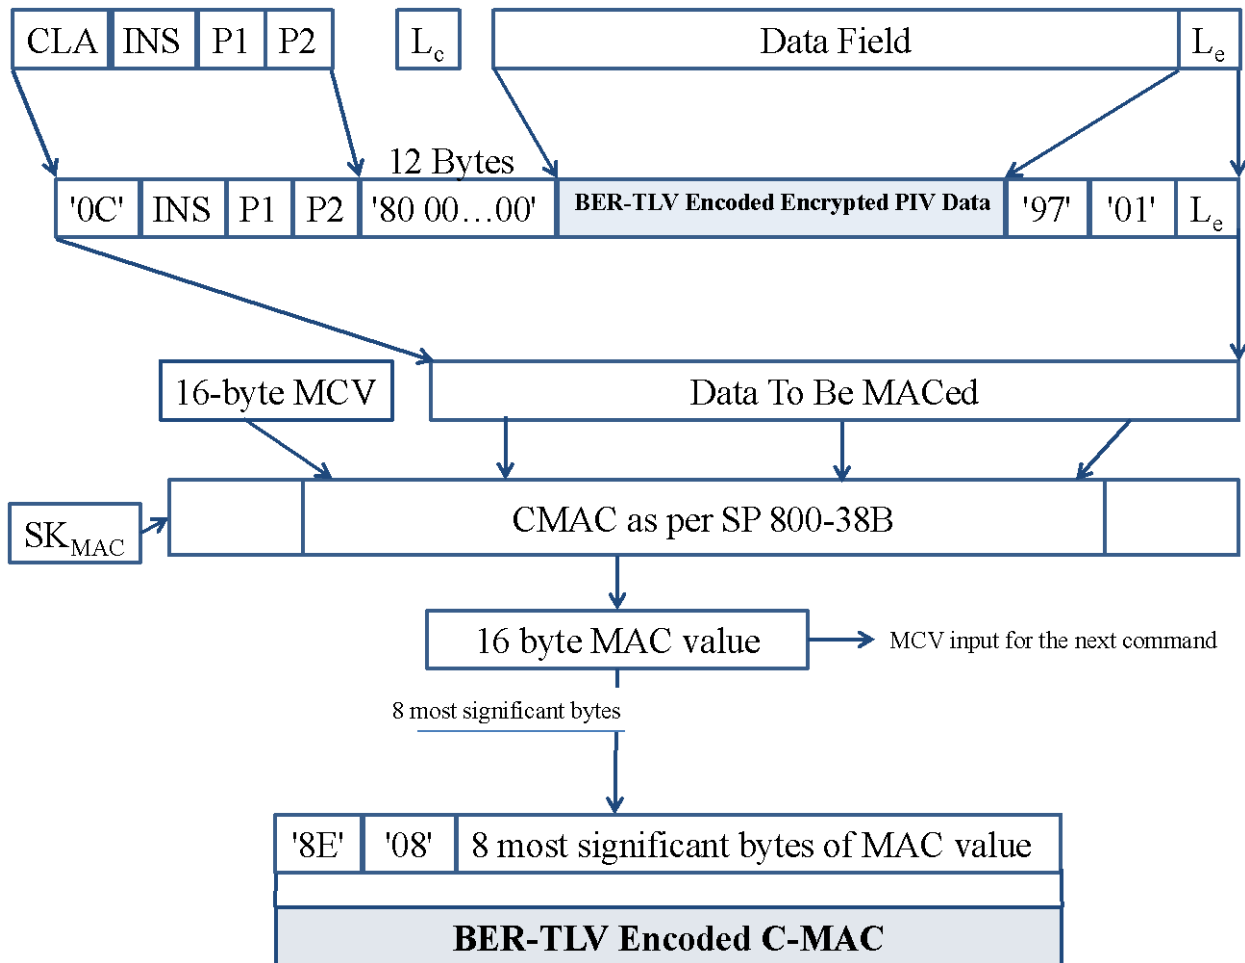

Figure 2. PIV Data Integrity of Command

832  
833  
834  
835

#### 4.2.4 Command with PIV Secure Messaging

836 For secure messaging, the secure messaging data field shall be constructed as the concatenation of the  
 837 following: the BER-TLV encoded encrypted PIV data;<sup>8</sup> the 3-byte BER-TLV encoded  $L_e$ , as described in  
 838 Section 4.2.3, if  $L_e$  would have been included in a message sent without secure messaging; and the 10-  
 839 byte BER-TLV encoded C-MAC of the command, as described in Section 4.2.3.

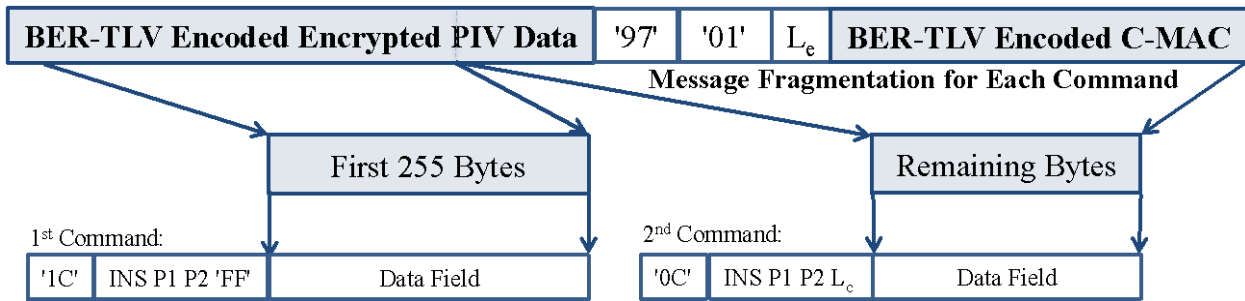

<sup>7</sup> The data field may be absent in the case of the VERIFY command.  
<sup>8</sup> The data field may be absent in the case of the VERIFY command.

840 The APDU for secure messaging is shown in Figure 3 for the case in which command chaining is not  
841 required. The APDU consists of the CLA byte ('0C'), INS, P1, P2, the length of the secure messaging  
842 data field ( $L_c$ ), and the secure messaging data field.

843  
844 **Figure 3. Single Command under Secure Messaging**

845 If secure messaging data field to be transported is larger than 255 bytes, command chaining will be  
846 needed. Figure 4 shows the APDUs for secure messaging for a case in which the length of the secure  
847 messaging data field is between 256 and 510 bytes, requiring the data to be fragmented across two  
848 APDUs. The APDUs are constructed in the same manner as when fragmentation is not required, except  
849 that the CLA byte for the first APDU is '1C', the first APDU contains the first 255 bytes of the secure  
850 messaging data field, and the second APDU contains the remaining bytes of the secure messaging data  
851 field. The PIV Card Application provides a two-byte response of '90 00' for the first APDU. After  
852 receiving the second APDU the PIV Card Application reconstructs and processes the entire command.

853  
854 **Figure 4. Chained Command under Secure Messaging**

855 **4.2.5 Response Integrity**

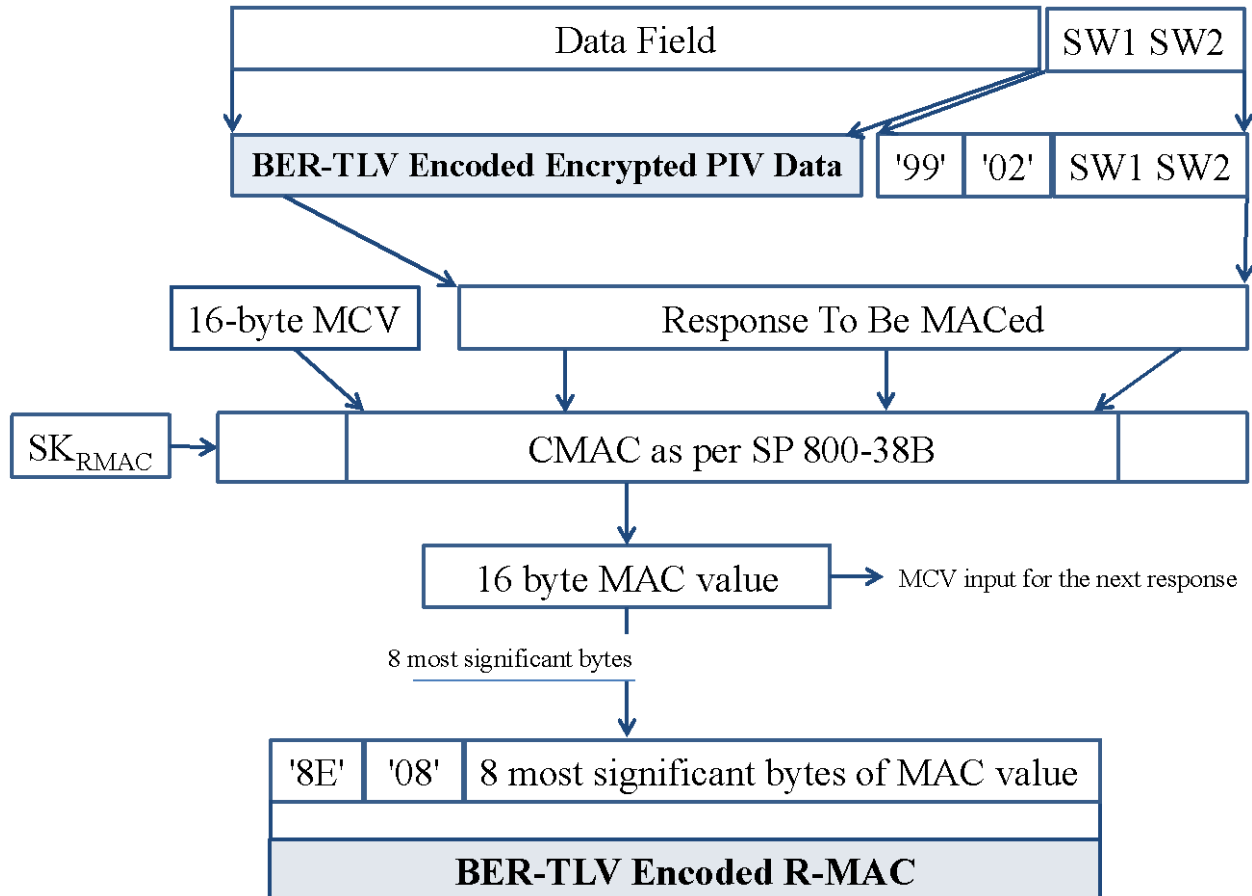

856 The Response MAC (R-MAC) shall be generated by applying CMAC [SP800-38B] to the data field and  
857 status bytes of the response using the  $SK_{R-MAC}$  session key. An R-MAC shall be generated for each  
858 response that corresponds to a command that was sent to the card using secure messaging.

859 The data to be MACed,  $M_{R-MAC}$ , shall be constructed by concatenating the following:

- 860 1. The 16-byte MAC chaining value (MCV). For the first response sent after successful completion  
861 of the key establishment protocol the MCV consists of 16 bytes of '00'. For each subsequent  
862 response the MCV is the 16-byte MAC value computed for the previous response.
- 863 2. The data field (if present), which is the BER-TLV encoded encrypted message.
- 864 3. The status words, SW1 and SW2, encapsulated in BER-TLV format with tag '99'.

865 Let  $T_{R-MAC} = \text{CMAC}(\text{SK}_{R-MAC}, M_{R-MAC})$  as described in [SP800-38B]. The BER-TLV encoded R-MAC for  
 866 the response shall be the 8 most significant bytes of  $T_{R-MAC}$  encapsulated in BER-TLV format with tag  
 867 '8E'. The entire 16-byte value  $T_{R-MAC}$  will be the MCV for the next response.

868 Figure 5 below illustrates how the R-MAC is generated for the response.

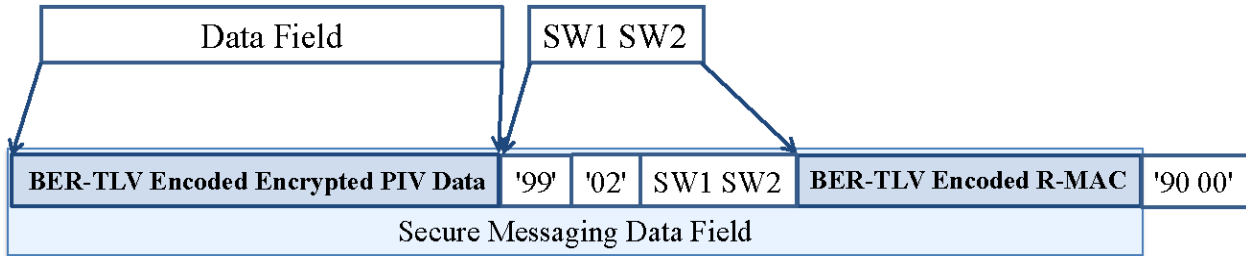

869  
 870 **Figure 5. PIV Data Integrity of Response**

#### 871 4.2.6 Response with PIV Secure Messaging

873 For secure messaging, the secure messaging data field that is sent by the PIV Card Application shall be  
 874 constructed as the concatenation of the following: the BER-TLV encoded encrypted message (when  
 875 present); the 4-byte BER-TLV encoded the status words, as described in Section 4.2.5; and the 10-byte  
 876 BER-TLV encoded R-MAC of the response, as described in Section 4.2.5.

877 Figure 6 illustrates a response under secure messaging for the case in which response chaining is not  
 878 required. The APDU consists of the secure messaging data field and the 2-byte SW protocol ('90 00'),  
 879 which indicates that the PIV Card Application successfully verified the C-MAC on the command and  
 880 decrypted the data field in the command (if present). If the PIV Card Application was unable to verify the  
 881 C-MAC on the command or decrypt the data field in the command, then it shall return a 2-byte error  
 882 response, as described in Section 4.2.7.

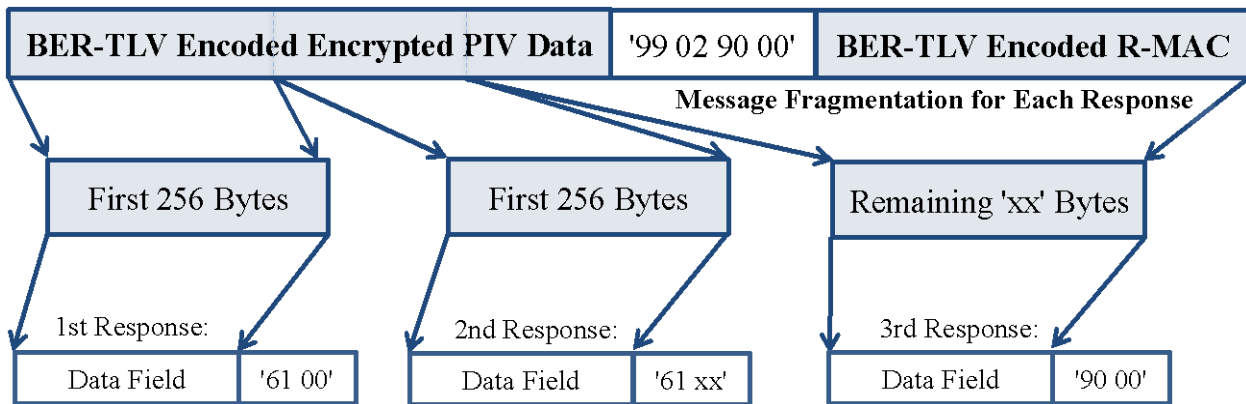

883  
884 **Figure 6. Single Response under Secure Messaging**

885

886 If the secure messaging data field to be transported is larger than 256 bytes, response chaining<sup>9</sup> will be  
887 needed. Figure 7 shows the APDUs for secure messaging that are sent by the PIV Card Application for a  
888 case in which the length of the secure messaging data field is between 513 and 768 bytes, requiring the  
889 data to be fragmented across three APDUs. After the first response an APDU of '00 C0 00 00 00' would  
890 be sent to request the second response, and after the second response an APDU of '00 C0 00 00 xx' would  
891 be sent to request the third response.

892  
893 **Figure 7. Chained Response under Secure Messaging**

894

895

#### 4.2.7 Error Handling

896 The SW protocol is the status byte of the overall secure messaging command and response processing. It  
897 indicates if the secure messaging was performed successfully. If the processing was successful, it shall be  
898 '90 00'; otherwise, it shall be as follows:

- 899 + '68 82' – Secure messaging not supported  
900 + '69 82' – Security condition not satisfied<sup>10</sup>  
901 + '69 87' – Expected secure messaging data objects are missing  
902 + '69 88' – Secure messaging data objects are incorrect

903 If the command processing was unsuccessful, the card shall return one of the above errors without  
904 performing further secure messaging.

<sup>9</sup> The response chaining is accomplished by issuing several GET RESPONSE commands to the card.

<sup>10</sup> Status word '69 82' is used when secure messaging is requested, but no session keys have been established.

905 **4.3 Session Key Destruction**

906 The session keys established after successful execution of the key establishment protocol in Section 4.1  
907 shall be zeroized in the following circumstances:

- 908 + the card is reset;
- 909 + an error occurs in secure messaging; or
- 910 + new session keys are requested by the client application by sending a GENERAL  
911 AUTHENTICATE command to the card to perform the key establishment protocol using  
912 the PIV Secure Messaging key.

913

914

915 **Appendix A—Examples of the Use of the GENERAL AUTHENTICATE Command**916 **A.1 Authentication of the PIV Card Application Administrator**

917 The PIV Card Application Administrator is authenticated by the PIV Card Application using a  
 918 challenge/response protocol. A challenge retrieved from the PIV Card Application is encrypted by the  
 919 client application and returned to the PIV Card Application associated with key reference '9B', the key  
 920 reference of the PIV Card Application Administration key. The PIV Card Application decrypts the  
 921 response using this reference data and the algorithm associated with the key reference (for example, 3  
 922 Key Triple DES – ECB, algorithm identifier '00'). If this decrypted value matches the previously  
 923 provided challenge, then the security status indicator of the PIV Card Application Administration key is  
 924 set to TRUE within the PIV Card Application.

925 Table 16 shows the GENERAL AUTHENTICATE card commands sent to the PIV Card Application to  
 926 realize this particular challenge/response protocol.

927 **Table 16. Authentication of PIV Card Application Administrator**

Command	Response	Comment
'00 87 00 9B 04 7C 02 81 00'		Client application requests a challenge from the PIV Card Application.
	'7C 0A 81 08 01 02 03 04 05 06 07 08 90 00'	Challenge ('01 02 03 04 05 06 07 08') returned to client application by the PIV Card Application.
'00 87 00 9B 0C 7C 0A 82 08 88 77 66 55 44 33 22 11'		Client application returns the encryption of the challenge ('88 77 66 55 44 33 22 11') referencing algorithm '00' and key reference '9B'. [SP800-78, Tables 6-1 and 6-2]
	'90 00'	PIV Card Application indicates successful authentication of PIV Card Application Administrator after decrypting '88 77 66 55 44 33 22 11' using the referenced algorithm and key and getting '01 02 03 04 05 06 07 08'.

928

929 **A.2 Mutual Authentication of Client Application and Card Application**

930 The PIV Card Application Administrator and the PIV Card Application authenticate each other using a  
 931 challenge/response protocol. A witness retrieved from the PIV Card Application is decrypted by the  
 932 client application and returned to the PIV Card Application associated with key reference '9B', the key  
 933 reference of the PIV Card Application Administration key. The command including the decrypted  
 934 witness also includes a challenge for the PIV Card Application. The PIV Card Application verifies that  
 935 the decrypted witness matches the value that it encrypted to create the witness. If it does, then the  
 936 security status indicator of the PIV Card Application Administration key is set to TRUE within the PIV  
 937 Card Application, and the PIV Card Application encrypts the challenge that it received from the client

938 application and returns the result. The witness and challenge are encrypted/decrypted using the same the  
 939 key and algorithm. Table 18 shows the GENERAL AUTHENTICATE card commands sent to the PIV  
 940 Card Application to realize mutual authentication using 3 Key Triple DES – ECB (algorithm identifier  
 941 '00').

942

**Table 17. Mutual Authentication of Client Application and PIV Card Application**

Command	Response	Comment
'00 87 00 9B 04 7C 02 80 00'		Client application requests a witness from the PIV Card Application.
	'7C 0A 80 08 88 77 66 55 44 33 22 11 90 00'	PIV Card Application returns a witness that is created by generating 8 bytes of random data ('01 02 03 04 05 06 07 08') and encrypting it using the referenced key ('9B') and algorithm ('00'). [SP800-78, Tables 6-1 and 6-2]
'00 87 00 9B 18 7C 16 80 08 01 02 03 04 05 06 07 08 81 08 09 0A 0B 0C 0D 0E 0F 10 82 00'		Client application returns the decrypted witness ('01 02 03 04 05 06 07 08') referencing algorithm '00' and key reference '9B'. Client application requests encryption of challenge data ('09 0A 0B 0C 0D 0E 0F 10') from the card using the same key.
	'7C 0A 82 08 11 FF EE DD CC BB AA 99 90 00'	PIV Card Application authenticates the client application by verifying the decrypted witness. PIV Card Application indicates successful authentication of PIV Card Application Administrator and sends back the encrypted challenge ('11 FF EE DD CC BB AA 99'). Client application authenticates the PIV Card Application by decrypting the encrypted challenge and getting ('09 0A 0B 0C 0D 0E 0F 10').

943

944

### **A.3 Authentication of PIV Cardholder**

945 The PIV cardholder is authenticated by first retrieving and validating either the X.509 Certificate for PIV  
 946 Authentication or the X.509 Certificate for Card Authentication. Assuming the certificate is valid, the  
 947 client application requests the PIV Card Application to sign a challenge using the private key associated  
 948 with this certificate (i.e., key reference '9A' or '9E') and the appropriate algorithm (e.g., algorithm  
 949 identifier '07'), which can be determined from the certificate as described in Part 1, Appendix C.1. The

950 response from the card is verified using the public key in the certificate. If the signature verifies, then the  
951 PIV cardholder is authenticated.

952 Table 17 shows the GENERAL AUTHENTICATE card commands sent to the PIV Card Application to  
953 realize the cardholder authentication when the X.509 Certificate for PIV Authentication includes a 2048-  
954 bit RSA public key. It is assumed that the cardholder PIN or OCC data has been successfully verified  
955 prior to sending the GENERAL AUTHENTICATE command.

956 **Table 18. Validation of the PIV Card Application Using GENERAL AUTHENTICATE**

Command	Response	Comment
'10 87 07 9A FF 7C 82 01 06 82 00 81 82 01 00 00 01 FF FF FF FF ... FF FF FF FF FF 00 9D F4 6E 09 E7 D6 19 18 53 1E 6E 1C 66 87 C4 3E CF FF 7D 53 47 BD 2E 93 19' ("..." represents 208 bytes of challenge data)		Client application sends a challenge to the PIV Card Application indicating the reference data associated with key reference '9A' is to be used with algorithm '07'. [SP800-78, Tables 6-1 and 6-2] The challenge data, which in this example is encoded as specified for TLS version 1.1 client authentication, is '00 01 FF ... 18 BC A7'. Bit 5 of CLA byte is set to one indicating command chaining is needed. L <sub>e</sub> is absent indicating no data is expected.
	'90 00'	PIV Card Application indicates it received the command successfully.
'00 87 07 9A 0B 94 53 76 FE A7 91 72 14 18 BC A7 00'		Client application sends remaining data with the second and last command of the chain. L <sub>e</sub> is '00' to indicate that the expected length of the response data field is 256 bytes.
	'7C 82 01 04 82 82 01 00 29 69 44 3B 49 AC 5B 70 63 51 A1 5B B5 ... AD F7 0B 7D A6 4C 6C AA 62 40 C5 FA A8 7E A2 2B DC 92 18 56 8B CE F4 69 14 D9 83 61 08' ("..." represents 208 bytes of response data)	PIV Card Application returns the result of signing the challenge using the indicated key reference data and algorithm ('29 69 44 3B 49 AC...'). The last two bytes '61 08' indicate 8 more bytes are available to read from the card.
'00 C0 00 00 08		The GET RESPONSE command is used to request remaining 8 bytes.
	'30 1B 11 06 AE E2 F1 2E 90 00	PIV Card Application sends the remaining 8 bytes.

957

958 **A.4 Signature Generation with the Digital Signature Key**

959 The GENERAL AUTHENTICATE command can be used to generate signatures. The pre-signature hash  
960 and padding (if applicable) is computed off card. The PIV Card Application receives the hashed value of  
961 the original message, applies the private signature key (key reference '9C'), and returns the resulting  
962 signature to the client application.

963 Listed below are the card commands sent to the PIV Card Application to generate a signature. It is  
964 assumed that the cardholder PIN or OCC data has been successfully verified prior to sending the  
965 GENERAL AUTHENTICATE command.

966 **A.4.1 RSA**

967 This example illustrates signature generation using RSA 2048 (i.e., algorithm identifier '07'). Command  
968 chaining is used in the first command since the padded hash value sent to the card for signature generation  
969 is bigger than the length of the data field.

970 **Command 1: (GENERAL AUTHENTICATE – first chain):**

<b>CLA</b>	'10' indicating command chaining
<b>INS</b>	'87'
<b>P1</b>	'07'
<b>P2</b>	'9C'
<b>L<sub>c</sub></b>	Length of data field
<b>Data Field</b>	'7C' – L1 { '82' '00' '81' L2 {first part of the PKCS #1 v1.5 or PSS padded message hash value } }
<b>L<sub>e</sub></b>	Absent (no response expected)

971  
972 **Response 1:**

<b>Data Field</b>	Absent
<b>SW1-SW2</b>	'90 00' (Status word)

973  
974 **Command 2: (GENERAL AUTHENTICATE – last chain):**

<b>CLA</b>	'00' indicates last command of the chain
<b>INS</b>	'87'
<b>P1</b>	'07'
<b>P2</b>	'9C'
<b>L<sub>c</sub></b>	Length of data field
<b>Data Field</b>	{second and last part of the PKCS #1 v1.5 or PSS padded message hash value}
<b>L<sub>e</sub></b>	Length of expected response

975  
976 **Response 2:**

<b>Data Field</b>	'7C' – L1 { '82' L2 {first part of signature} }
<b>SW1-SW2</b>	'61 xx' where xx indicates the number of bytes remaining to send by the PIV Card Application

977 **Command 3: (GET RESPONSE APDU):**  
978

<b>CLA</b>	'00'
<b>INS</b>	'C0'
<b>P1</b>	'00'
<b>P2</b>	'00'
<b>L<sub>e</sub></b>	xx Length of remaining response as indicated by previous SW1-SW2

979  
980 **Response 3:**

<b>Data Field</b>	{second and last part of signature}
<b>SW1-SW2</b>	'90 00' (Status word)

981  
982 **A.4.2 ECDSA**

983 The following example illustrates signature generation with ECDSA using ECC: Curve P-256 (i.e.,  
984 algorithm identifier '11'). Command chaining is not used in this example, as the hash value fits into the  
985 data field of the command. Padding does not apply to ECDSA.

986 **Command – GENERAL AUTHENTICATE**

<b>CLA</b>	'00'
<b>INS</b>	'87'
<b>P1</b>	'11'
<b>P2</b>	'9C'
<b>L<sub>c</sub></b>	Length of data field
<b>Data Field</b>	'7C' – L1 { '82' '00' '81' L2 {hash value of message}}
<b>L<sub>e</sub></b>	Length of expected response

987  
988 **Response:**

<b>Data Field</b>	<p>'7C' – L1 { '82' L2 (r,s) } where</p> <ul style="list-style-type: none"> <li>(r,s) is DER encoded with the following ASN.1 structure:           <pre style="margin-left: 40px;">Ecdsa-Sig-Value ::= SEQUENCE {               r  INTEGER,               s  INTEGER }</pre> </li> <li>L1 is the length of tag '82' TLV structure</li> <li>L2 is the length of the DER encoded Ecdsa-Sig-Value structure</li> </ul>
<b>SW1-SW2</b>	'90 00' (Status word)

989  
990  
991 **A.5 Key Establishment Schemes with the PIV Key Management Key**

992 FIPS 201 specifies a public key pair and associated X.509 Certificate for Key Management. The key  
993 management key (KMK) is further defined in SP 800-78, which defines two distinct key establishment  
994 schemes for the KMK:

- 995 1) RSA key transport and  
996 2) Elliptic Curve Diffie-Hellman (ECDH) key agreement.

997 The use of the KMK for RSA key transport and ECDH key agreement is discussed in Appendices A.5.1  
998 and A.5.2, respectively.

### 999 **A.5.1 RSA Key Transport**

1000 In general, RSA transport keys are used to establish symmetric keys, where a sender encrypts a symmetric  
1001 key with the receiver's public key and sends the encrypted key to the receiver. The receiver decrypts the  
1002 encrypted key with the corresponding private key. The decrypted symmetric key subsequently is used by  
1003 both parties to protect further communication between them. Many types of security protocols employ  
1004 the RSA key transport technique. S/MIME for secure email is one of the many protocols employing RSA  
1005 transport keys to distribute symmetric keys between entities.

#### 1006 **A.5.1.1 RSA Key Transport with the PIV KMK**

1007 As specified in SP 800-78, the on-card private KMK can be an RSA transport key that complies with  
1008 [PKCS1]. In the scenario described above, a sender encrypts a symmetric key with the KMK's public  
1009 RSA transport key. The role of the on-card KMK private RSA transport key is to decrypt the sender's  
1010 symmetric key on behalf of the cardholder and provide it to the client application cryptographic module.

##### 1011 **A.5.1.1.1 The GENERAL AUTHENTICATE Command**

1012 Listed below are the card commands sent to the PIV Card to decrypt the symmetric key. It is assumed  
1013 that the cardholder's PIN or OCC data has been successfully verified prior to sending the GENERAL  
1014 AUTHENTICATE command to the card.

#### 1015 **Command 1 – GENERAL AUTHENTICATE (first chain)**

<b>CLA</b>	'10' indicates command chaining
<b>INS</b>	'87'
<b>P1</b>	'07'

1030

**A.5.2 Elliptic Curve Cryptography Diffie-Hellman**

1031

1032

1033

1034

1035

An ECDH key agreement scheme does not send an encrypted symmetric key to the participating entities. Instead, the two entities involved in the key agreement scheme compute a shared secret by combining their ECC private key(s) with the other party's public key(s). The resulting shared secret (Z) serves as an input to a key derivation function (KDF), which each entity independently invokes to derive a common secret key. The secret key may be used as a session key or may be used to encrypt a session key.

1036

**A.5.2.1 ECDH with the PIV KMK**

1037

1038

1039

1040

1041

The PIV Card supports ECDH key agreement by performing the elliptic curve cryptography cofactor Diffie-Hellman (ECC CDH) primitive [SP800-56A, Section 5.7.1.2] using its ECC KMK private key and an ECC public key that is provided as input to the GENERAL AUTHENTICATE command. All other procedures required to complete the key agreement are performed by the cardholder's client application and its associated cryptographic module.

1042 **A.5.2.1.1 The GENERAL AUTHENTICATE Command**

1043 The sequence of commands to perform the ECC CDH primitive from [SP800-56A, Section 5.7.1.2] with  
1044 the private ECC KMK is illustrated below for ECC: Curve P-256:

1045 **Command – GENERAL AUTHENTICATE**

1046

<b>CLA</b>	'00'
<b>INS</b>	'87'
<b>P1</b>	'11'
<b>P2</b>	'9D'
<b>L<sub>c</sub></b>	Length of data field
<b>Data Field</b>	'7C' – L1 {'82' '00' '85' L2 { '04'    X    Y}} , where <ul style="list-style-type: none"> <li>'04'    X    Y is the other party's public key, a point on Curve P-256, encoded without the use of point compression as described in [SECG, Section 2.3.3].</li> <li>The length of each coordinate (X and Y) is 32 bytes and</li> <li>The value of L2 is 65 bytes</li> </ul>
<b>L<sub>e</sub></b>	Length of expected response

1047

1048

**Response:**

<b>Data Field</b>	'7C' – L1 {'82' L2 {shared secret Z}} where <ul style="list-style-type: none"> <li>Z is the X coordinate of point P as defined in [SP800-56A, Section 5.7.1.2]</li> <li>L2 is 32 bytes</li> </ul>
<b>SW1-SW2</b>	'90 00' (Status word)

1049

1050

**A.5.2.2 PIV KMK Specific ECDH Key Agreement Schemes**

1051 SP 800-56A describes five different ECDH key agreement schemes that a client application cryptographic  
1052 module may implement. These schemes differ in 1) the number of keys (1 or 2) and 2) the type of keys  
1053 (ephemeral or static) used by each party. Since the PIV Card only computes the ECC CDH primitive  
1054 using its static private key, the client application cryptographic module only employs the PIV Card in  
1055 implementing an ECDH key agreement scheme when the scheme involves the use of the cardholder's  
1056 static key pair. The ECDH key agreement schemes that involve the use of at least one party's static key  
1057 pair, and thus may involve the use of the PIV Card are:

1058

1059

- + C(2, 2) – Each party has a static key pair and generates an ephemeral key pair [SP800-56A, Section 6.1.1]

1060

1061

1062

1063

1064

1065

In this scheme, the information sent between the client application and the PIV Card is the same when acting as the initiator or the responder; the other party's static public key is sent to the PIV Card, and a static shared secret is returned by the PIV Card in plaintext. Note that an ephemeral key pair is generated by the client application, and the private key of that key pair is combined with the other party's ephemeral public key to produce an ephemeral shared secret.

1066

1067

- + C(1, 2) – The initiator has a static key pair and generates an ephemeral key pair, while the responder has a static key pair [SP800-56A, Section 6.2.1]

1068 When the cardholder is acting as the initiator, the other party's static public key is sent to  
1069 the PIV Card, and a static shared secret is returned in plaintext by the PIV Card. Note that  
1070 in this case, an ephemeral key pair is generated by the client application's cryptographic  
1071 module, and the corresponding ephemeral private key is combined with the other party's  
1072 static public key to produce a second shared secret.

1073 When the cardholder is acting as the responder, two public keys are sent by the client  
1074 application to the PIV Card (the other party's static and ephemeral public keys), and two  
1075 shared secrets are returned in plaintext (the static shared secret and the ephemeral shared  
1076 secret). Note that two GENERAL AUTHENTICATE commands are required to provide  
1077 the two shared secrets to the client application's cryptographic module.

1078 + C(1, 1) – The initiator generates only an ephemeral key pair, while the responder has only a  
1079 static key pair [SP800-56A, Section 6.2.2]

1080 In this scheme, the PIV Card is only employed by the client application if the cardholder is  
1081 acting as the responder. In this case, the other party's ephemeral public key is sent to the  
1082 PIV Card, and the shared secret is returned by the PIV Card in plaintext.

1083 + C(0, 2) – Both the initiator and responder use only static key pairs [SP800-56A, Section  
1084 6.3]

1085 In the C(0, 2) scheme, the information sent between the client application's cryptographic  
1086 module and the PIV Card is the same when acting as the initiator or the responder; the  
1087 other party's static public key is sent to the PIV Card, and the static shared secret is  
1088 returned in plaintext. Note that for this scheme, the client application's cryptographic  
1089 module also generates a nonce when acting as the initiator of the scheme.

1090 The C(2, 0) scheme does not involve the use of static keys and so the PIV Card would not be involved in  
1091 the implementation of this scheme.

## 1092 **A.6 Authentication of the PIV Cardholder Over the Virtual Contact Interface**

1093 If the PIV Card supports secure messaging and the pairing code, then all non-card-management  
1094 operations of the PIV Card Application may be performed over the contactless interface. In order to  
1095 perform an operation that would otherwise be restricted to the contact interface, the key establishment  
1096 protocol in Section 4.1 needs to be performed to establish session keys for secure messaging, and then the  
1097 pairing code needs to be submitted over secure messaging in order to establish a virtual contact interface.

1098 This appendix shows an example of the establishment of a VCI and its use to perform cardholder  
1099 authentication using the PIV Authentication key. First, the GENERAL AUTHENTICATE command is  
1100 used to perform the key establishment protocol, and then the VERIFY command is used to submit the  
1101 pairing code and establish the VCI. At this point the GET DATA command is used to read the X.509  
1102 Certificate for PIV Authentication. Then the GENERAL AUTHENTICATE command is used to perform  
1103 a challenge/response with the PIV Authentication key after the PIN is submitted using the VERIFY  
1104 command.

Command	Response	Comment
00 87 27 03 4E 81 4A 10 00 00 00 00 00 00 00 00 04 X Y 82 00		The GENERAL AUTHENTICATE command is used to perform the key establishment protocol, as specified in Section 4.1.8, where cipher suite CS2 is being used, ID <sub>SH</sub> is all zeros, and X and Y are the coordinates of Q <sub>eH</sub> . X and Y are 32 bytes each.
	82 LL 10 N <sub>ICC</sub> AuthCryptogram <sub>ICC</sub> EncGUID C <sub>ICC</sub> *	The response for the key establishment protocol, as specified in Section 4.1.8, where N <sub>ICC</sub> , AuthCryptogram <sub>ICC</sub> , and EncGUID are 16 bytes each, and C <sub>ICC</sub> * is as specified in Sections 4.1.3 and 4.1.5.
After the client application verifies C <sub>ICC</sub> and the authentication cryptogram and validates the content signing certificate needed to verify the signature on C <sub>ICC</sub> , the PIV Card has been authenticated and session keys for secure messaging have been established (SK <sub>ENC</sub> , SK <sub>MAC</sub> , and SK <sub>RMAC</sub> ).		
The VERIFY command is used to submit the pairing code (“65135275”) to the PIV Card Application. For the command, ENC <sub>C1</sub> is the result of encrypting '36 35 31 33 35 32 37 35 80 00 00 00 00 00 00 00' using an IV of AES(SK <sub>ENC</sub> , '00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 01') and T <sub>C-MAC,1</sub> = CMAC(SK <sub>MAC</sub> , '00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 0C 20 00 98 80 00 00 00 00 00 00 00 00 00 00 87 11 01'    ENC <sub>C1</sub> ). For the response, T <sub>R-MAC,1</sub> = CMAC(SK <sub>RMAC</sub> , '00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 99 02 90 00').		
0C 20 00 98 1D 87 11 01 ENC <sub>C1</sub> 8E 08 T <sub>8</sub> (T <sub>C-MAC,1</sub> )		The VERIFY command is used over secure messaging to submit the pairing code to the card.
	99 02 90 00 8E 08 T <sub>8</sub> (T <sub>R-MAC,1</sub> ) 90 00	The card responds that the command has been successfully executed, and that the VCI has been established.
Once the VCI has been established, the GET DATA command may be used to retrieve the X.509 Certificate for PIV Authentication. For the command, ENC <sub>C2</sub> is the result of encrypting '5C 03 5F C1 05 80 00 00 00 00 00 00 00 00 00 00' using an IV of AES(SK <sub>ENC</sub> , '00 00 00 00 00 00 00 00 00 00 00 00 00 00 02'), and T <sub>C-MAC,2</sub> is computed using T <sub>C-MAC,1</sub> as the MCV. For the response, ENC <sub>R2</sub> is the result of encrypting the X.509 Certificate for PIV Authentication data object encapsulated in BER-TLV format with tag '53' using an IV of AES(SK <sub>ENC</sub> , '80 00 00 00 00 00 00 00 00 00 00 00 00 00 02'), and T <sub>R-MAC,2</sub> is computed using T <sub>R-MAC,1</sub> as the MCV.		
0C CB 3F FF 20 87 11 01 ENC <sub>C2</sub> 97 01 00 8E 08 T <sub>8</sub> (T <sub>C-MAC,2</sub> )		The GET DATA command is used to request the X.509 Certificate for PIV Authentication. The command is submitted over VCI.

Command	Response	Comment
	87 82 05 91 01 <bytes 1 – 251 of ENC <sub>R2</sub> > 61 00	The response includes the tag, length, and padding indicator bytes of the BER-TLV encoded encrypted response data along with the first 251 bytes of the encrypted response, and an indicator that at least 256 bytes of additional data is available. The padding indicator is '01' to indicate that padding was required.
0C C0 00 00 00		Request the next 256 bytes of the response.
	<bytes 252 – 507 of ENC <sub>R2</sub> > 61 00	Return the next 256 bytes of the response.
...	...	
0C C0 00 00 A3		Request the final 163 bytes of the response.
	<bytes 1276 – 1424 of ENC <sub>R2</sub> > 99 02 90 00 8E 08 T <sub>8</sub> (T <sub>R-MAC,2</sub> ) 90 00	Return the final 163 bytes of the response, including the BER-TLV encoded status words for the command and the BER-TLV encoded R-MAC.
<p>At this point the VERIFY command could be used to submit the PIV Card Application PIN to the PIV Card Application. However, in this example, for illustrative purposes only, a VERIFY command is sent to the card without a data field in order to retrieve the current value of the retry counter associated with the PIV Card Application PIV.</p> <p>For the command,</p>		
0C 20 00 80 0A 8E 08 T <sub>8</sub> (T <sub>C-MAC,3</sub> )		The VERIFY command is used to retrieve the number of further retries allowed for the PIV Card Application PIN.
	99 02 63 C3 8E 08 T <sub>8</sub> (T <sub>R-MAC,3</sub> ) 90 00	The PIV Card Application indicates that 3 further retries are allowed ('63 C3').
<p>The VERIFY command is used to submit the PIV Card Application PIN to the PIV Card Application. Other than the key reference and the PIN value, the command and response are the same as when using the VERIFY command to submit the pairing code.</p> <p>For the command, ENC<sub>C3</sub> is the result of encrypting the PIN value along with the padding bytes using an IV of AES(SK<sub>ENC</sub>, '00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 03'), and T<sub>C-MAC,4</sub> is computed using T<sub>C-MAC,3</sub> as the MCV. [Note that the encryption counter used to generate the IV was not incremented as of result of the previous VERIFY command since no encryption was performed for that command.]</p> <p>For the response, T<sub>R-MAC,4</sub> is computed using T<sub>R-MAC,3</sub> as the MCV.</p>		
0C 20 00 80 1D 87 11 01 ENC <sub>C3</sub> 8E 08 T <sub>8</sub> (T <sub>C-MAC,4</sub> )		The VERIFY command is used to submit the PIV Card Application PIN to the card.
	99 02 90 00 8E 08 T <sub>8</sub> (T <sub>R-MAC,4</sub> ) 90 00	The card responds that the command has been successfully executed.

Command	Response	Comment
<p>Now that a virtual contact interface has been established and the PIV Card Application PIN has been verified, privileged operations may be performed over the contactless interface. So, the GENERAL AUTHENTICATE command is used to perform a challenge/response with the PIV Authentication key. For the command, ENC<sub>C5</sub> is the result of encrypting the challenge along with the padding bytes using an IV of AES(SK<sub>ENC</sub>, '00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 04'), and T<sub>C-MAC,5</sub> is computed using T<sub>C-MAC,4</sub> as the MCV. The challenge to be encrypted is '7C 82 01 06 82 00 81 82 01 00 00 01 FF FF ... BC A7' from the example in Table 18.</p> <p>For the response ENC<sub>R5</sub> is the result of encrypting the response using an IV of AES(SK<sub>ENC</sub>, '80 00 00 00 00 00 00 00 00 00 00 00 00 00 04'), and T<sub>R-MAC,5</sub> is computed using T<sub>R-MAC,4</sub> as the MCV. The response to be encrypted is '7C 82 01 04 82 82 01 00 29 69 44 3B ... E2 F1 2E' from the example in Table 18.</p>		
1C 87 07 9A FF 87 82 01 11 01 <bytes 1 – 250 of ENC <sub>C5</sub> >		The GENERAL AUTHENTICATE command is used to send a challenge to the PIV Card. This command includes the first part of the challenge.
	90 00	PIV Card Application indicates that it received the first part of the command successfully.
0C 87 07 9A 23 <bytes 251 – 272 of ENC <sub>C5</sub> > 97 01 00 8E 08 T <sub>8</sub> (T <sub>C-MAC,5</sub> )		The remaining challenge data is sent, including the BER-TLV encoded L <sub>e</sub> and the BER-TLV encoded C-MAC.
	87 82 01 17 02 <bytes 1 – 251 of ENC <sub>R5</sub> > 61 1B	PIV Card Application sends first part of the result of signing the challenge. The padding indicator is '02' to indicate that no padding was required.
0C C0 00 00 1B		The remaining portion of response is requested.
	<bytes 252 – 264 of ENC <sub>R5</sub> > 99 02 90 00 8E 08 T <sub>8</sub> (T <sub>R-MAC,5</sub> ) 90 00	PIV Card Application sends final portion of the result of signing the challenge, along with the BER-TLV encoded status words and R-MAC.

1105

1106

1107

1108 **Appendix B—Terms, Acronyms, and Notation**1109 **B.1 Terms**

1110	Application Identifier	A globally unique identifier of a card application as defined in ISO/IEC 7816-4.
1111	Algorithm Identifier	A PIV algorithm identifier is a one-byte identifier that specifies a cryptographic algorithm and key size. For symmetric cryptographic operations, the algorithm identifier also specifies a mode of operation (i.e., ECB).
1112		
1113		
1114	Authenticable Entity	An entity that can successfully participate in an authentication protocol with a card application.
1115		
1116	BER-TLV Data Object	A data object coded according to ISO/IEC 8825-2.
1117	Card	An integrated circuit card.
1118	Card Application	A set of data objects and card commands that can be selected using an application identifier.
1119		
1120	Card Verifiable Certificate	A certificate stored on the card that includes a public key, the signature of a certification authority, and further information needed to verify the certificate.
1121		
1122	Data Object	An item of information seen at the card command interface for which is specified a name, a description of logical content, a format, and a coding.
1123		
1124	Key Reference	A PIV key reference is a one-byte identifier that specifies a cryptographic key according to its PIV Key Type. The identifier is part of cryptographic material used in a cryptographic protocol such as an authentication or a signing protocol.
1125		
1126		
1127	MAC Chaining Value	MAC Chaining Value is a 16-byte value that is input to the CMAC function. It is used to detect communication errors in duplicate or missing commands.
1128		
1129	Object Identifier	A globally unique identifier of a data object as defined in ISO/IEC 8824-2.
1130	Reference Data	Cryptographic material used in the performance of a cryptographic protocol such as an authentication or a signing protocol. The reference data length is the maximum length of a password or PIN. For algorithms, the reference data length is the length of a key.
1131		
1132		
1133		
1134	Status Word	Two bytes returned by an integrated circuit card after processing any command that signify the success of or errors encountered during said processing.
1135		
1136	Template	A (constructed) BER-TLV data object whose value field contains specific BER-TLV data objects.
1137		
1138		

1139	<b>B.2</b>	<b>Acronyms</b>
1140	AES	Advanced Encryption Standard
1141	AID	Application Identifier
1142	APDU	Application Protocol Data Unit
1143	API	Application Programming Interface
1144	APT	Application Property Template
1145	ASCII	American Standard Code for Information Interchange
1146	ASN.1	Abstract Syntax Notation One
1147	BER	Basic Encoding Rules
1148	CLA	Class (first) byte of a card command
1149	CMAC	Cipher-based Message Authentication Code
1150	C-MAC	Command Message Authentication Code
1151	CVC	Card Verifiable Certificate
1152	DER	Distinguished Encoding Rules
1153	DES	Data Encryption Standard
1154	ECB	Electronic Codebook
1155	ECC	Elliptic Curve Cryptography
1156	ECDSA	Elliptic Curve Digital Signature Algorithm
1157	ECDH	Elliptic Curve Diffie-Hellman
1158	EC CDH	Elliptic Curve Cryptography Cofactor Diffie-Hellman
1159		
1160	FIPS	Federal Information Processing Standards
1161	FISMA	Federal Information Security Management Act
1162	HSPD	Homeland Security Presidential Directive
1163	ICC	Integrated Circuit Card
1164	IEC	International Electrotechnical Commission
1165	IETF	Internet Engineering Task Force
1166	INS	Instruction (second) byte of a card command
1167	INCITS	InterNational Committee for Information Technology Standards
1168	ISO	International Organization for Standardization
1169	ITL	Information Technology Laboratory
1170	KDF	Key Derivation Function
1171	LSB	Least Significant Bit
1172	MAC	Message Authentication Code
1173	MSB	Most Significant Bit
1174	MCV	MAC Chaining Value
1175	NIST	National Institute of Standards and Technology
1176	OCC	On-Card Biometric Comparison
1177	OID	Object Identifier

1178	OMB	Office of Management and Budget
1179	P1	First parameter of a card command
1180	P2	Second parameter of a card command
1181	PKCS	Public-Key Cryptography Standards
1182	PIN	Personal Identification Number
1183	PIV	Personal Identity Verification
1184	PIX	Proprietary Identifier extension
1185	PUK	PIN Unblocking Key
1186	RFU	Reserved for Future Use
1187	RID	Registered application provider Identifier
1188	R-MAC	Response Message Authentication Code
1189	RSA	Rivest, Shamir, Adleman
1190	SM	Secure Messaging
1191	S/MIME	Secure/Multipurpose Internet Mail Extensions
1192	SP	Special Publication
1193	SW1	First byte of a two-byte status word
1194	SW2	Second byte of a two-byte status word
1195	TLS	Transport Layer Security
1196	TLV	Tag-Length-Value
1197	VCI	Virtual Contact Interface

### 1198 **B.3 Notation**

1199 The sixteen hexadecimal digits shall be denoted using the alphanumeric characters 0, 1, 2, ..., 9, A, B, C,  
 1200 D, E, and F. A byte consists of two hexadecimal digits, for example, '2D'. The two hexadecimal digits  
 1201 are represented in quotations '2D' or as 0x2D. A sequence of bytes may be enclosed in single quotation  
 1202 marks, for example 'A0 00 00 01 16', rather than given as a sequence of individual bytes, 'A0' '00' '00' '01'  
 1203 '16'.

1204 A byte can also be represented by bits b8 to b1, where b8 is the most significant bit (MSB) and b1 is the  
 1205 least significant bit (LSB) of the byte. In textual or graphic representations, the leftmost bit is the MSB.  
 1206 Thus, for example, the most significant bit, b8, of '80' is 1 and the least significant bit, b1, is 0.

1207 All bytes specified as RFU shall be set to '00' and all bits specified as RFU use shall be set to 0.

1208 All lengths shall be measured in number of bytes unless otherwise noted.

1209 The expression X & Y is a bitwise AND operation between bytes X and Y.

1210 The symbol || means concatenation of byte strings. For example, if X is '00 01 02' and Y is '03 04 05',  
 1211 then X || Y is '00 01 02 03 04 05'.

1212 Data objects in templates are described as being mandatory (M), optional (O), or conditional (C).  
 1213 'Mandatory' means the data object shall appear in the template. 'Optional' means the data object may  
 1214 appear in the template. In the case of 'Conditional' data objects, the conditions under which they are  
 1215 required are provided.

1216 In other tables the M/O/C column identifies properties of the PIV Card Application that shall be present  
1217 (M), may be present (O), or are conditionally required to be present (C).

1218 BER-TLV data object tags are represented as byte sequences as described above. Thus, for example,  
1219 0x4F is the interindustry data object tag for an application identifier and 0x7F60 is the interindustry data  
1220 object tag for the biometric information template.

1221
