FOREWORD

18

19 The Federal Information Processing Standards Publication Series of the National Institute
20 of Standards and Technology is the official series of publications relating to standards
21 and guidelines adopted and promulgated under the provisions of the Federal Information
22 Security Modernization Act (FISMA) of 2014.

23 Comments concerning Federal Information Processing Standard publications are
24 welcomed and should be addressed to the Director, Information Technology Laboratory,
25 National Institute of Standards and Technology, 100 Bureau Drive, Stop 8900,
26 Gaithersburg, MD 20899-8900.

27

Charles H. Romine, Director
Information Technology Laboratory

28

ABSTRACT

30 Authentication of an individual's identity is a fundamental component of physical and
31 logical access control. An access control decision must be made when an individual
32 attempts to access security-sensitive buildings, information systems, and applications. An
33 accurate determination of an individual's identity supports making sound access control
34 decisions.

35 This document establishes a standard for a Personal Identity Verification (PIV) system
36 that meets the control and security objectives of Homeland Security Presidential
37 Directive-12 [HSPD-12]. It is based on secure and reliable forms of identity credentials
38 issued by the Federal Government to its employees and contractors. These credentials
39 are used by mechanisms that authenticate individuals who require access to federally
40 controlled facilities, information systems, and applications. This Standard addresses
41 requirements for initial identity proofing, infrastructure to support interoperability
42 of identity credentials, and accreditation of organizations and processes issuing PIV
43 credentials.

Keywords: authentication, authenticator, biometrics, credential, cryptography, derived PIV credentials, digital identity, Federal Information Processing Standards (FIPS), HSPD-12, federation, identification, identity proofing, integrated circuit card, Personal Identity Verification, PIV, PIV account, public key infrastructure, verification

46 **Announcing the Standard for**
47 **Personal Identity Verification (PIV)**
48 **of Federal Employees and Contractors**

49 Federal Information Processing Standards Publications (FIPS PUBS) are issued by the
50 National Institute of Standards and Technology (NIST) after approval by the Secretary of
51 Commerce pursuant to Section 5131 of the Information Technology Management Reform
52 Act of 1996 (Public Law 104-106) and the Computer Security Act of 1987 (Public Law
53 100-235).

54 **1. Name of Standard.** Personal Identity Verification (PIV) of Federal Employees and
55 Contractors (FIPS 201-3).

56 **2. Category of Standard.** Information Security. **Subcategory.** Identity.

57 **3. Explanation.** Homeland Security Presidential Directive-12 [[HSPD-12](#)], dated
58 August 27, 2004, entitled “Policy for a Common Identification Standard for Federal
59 Employees and Contractors,” directs the promulgation of a federal standard for secure and
60 reliable forms of identification for federal employees and contractors. It further specifies
61 secure and reliable identification that

- 62 a) is issued based on sound criteria for verifying an individual employee’s identity;
- 63 b) is strongly resistant to identity fraud, tampering, counterfeiting, and terrorist
64 exploitation;
- 65 c) can be rapidly authenticated electronically; and
- 66 d) is issued only by providers whose reliability has been established by an official
67 accreditation process.

68 The directive stipulates that the Standard include graduated criteria from least secure to
69 most secure in order to ensure flexibility in selecting the appropriate level of security
70 for each application. Executive departments and agencies are required to implement the
71 Standard for identification issued to federal employees and contractors in gaining physical
72 access to controlled facilities and logical access to controlled information systems.

73 **4. Approving Authority.** Secretary of Commerce.

74 **5. Maintenance Agency.** Department of Commerce, NIST, Information Technology
75 Laboratory (ITL).

76 **6. Applicability.** This Standard is applicable to identification issued by federal
77 departments and agencies to federal employees and contractors for gaining physical access
78 to federally controlled facilities and logical access to federally controlled information
79 systems, except for “national security systems” as defined by 44 U.S.C. 3542(b)(2) and
80 [SP 800-59]. Except as provided in [HSPD-12], nothing in this Standard alters the ability
81 of government entities to use the Standard for additional applications.

82 **6.1 Special-Risk Security Provision.** The U.S. Government has personnel, facilities,
83 and other assets deployed and operating worldwide under a vast range of threats (e.g.,
84 terrorist, technical, intelligence), the severity of which is particularly heightened overseas.
85 For cardholders with particularly sensitive threats while outside of the contiguous
86 United States, the issuance, holding, and/or use of PIV credentials with full technical
87 capabilities as described herein may result in unacceptably high risk. In such cases of
88 risk (e.g., to facilities, individuals, operations, national interest, or national security) by
89 the presence and/or use of full-capability PIV credentials, the head of a department or
90 independent agency may issue a select number of maximum-security PIV credentials
91 that do not contain (or otherwise do not fully support) the wireless and/or biometric
92 capabilities otherwise required/referenced herein. To the greatest extent practicable,
93 heads of departments and independent agencies should minimize the issuance of such
94 special-risk security PIV credentials so as to support interagency interoperability and
95 the President’s policy. Use of other risk-mitigating technical (e.g., high-assurance on/off
96 switches for the wireless capability) and procedural mechanisms in such situations is
97 preferable and, as such, is also explicitly permitted and encouraged. As protective security
98 technology advances, the need for this provision will be reassessed when the Standard
99 undergoes the normal review and update process.

100 **7. Implementations.** This Standard satisfies the control objectives, security
101 requirements, and technical interoperability requirements of [HSPD-12]. The Standard
102 specifies implementation and processes for binding identities to authenticators, such as
103 integrated circuit cards and derived credentials used in the federal PIV system.

104 In implementing PIV systems and pursuant to Section 508 of the Rehabilitation Act of
105 1973 (the Act), as amended, agencies have the responsibility to accommodate federal
106 employees and contractors with disabilities to have access to and use of information
107 and data comparable to the access to and use of such information and data by federal
108 employees and contractors who are not individuals with disabilities. In instances where
109 federal agencies assert exceptions to Section 508 accessibility requirements (e.g., undue
110 burden, national security, commercial non-availability), Sections 501 and 504 of the Act
111 require federal agencies to provide reasonable accommodation for federal employees
112 and contractors with disabilities whose needs are not met by the baseline accessibility
113 provided under Section 508. While Section 508 compliance is the responsibility of
114 federal agencies and departments, this Standard specifies several options to aid in the
115 implementation of the requirements:

- 116 • [Section 4.1.4.3](#) specifies Zones 21F and 22F as options for orientation markers of
117 the PIV Card.
- 118 • [Section 2.8](#) and [Section 2.9](#) specify alternatives for the biometric capture device
119 interactions required at PIV Card issuance, reissuance, and reset.
- 120 • [Section 2.10](#) defines alternatives to smart card-based PIV credentials in the form of
121 derived PIV credentials.
- 122 • [Section 6](#) defines authentication mechanisms with varying characteristics for both
123 physical and logical access (e.g., with or without PIN, over contact, contactless, or
124 virtual contact interface).
- 125 • [Section 7](#) defines federation as a means for a relying system to interoperate with
126 credentials issued by other agencies.

127 The Office of Management and Budget (OMB) provides implementation oversight for this
128 Standard.

129 PIV cards can only be issued by accredited issuers. The responsibility and authority for
130 PIV card issuance and management rests in the departments and agencies employing
131 federal employees and contractors regardless of whether these functions are performed in-
132 house or outsourced to an external public or private organization. To ensure consistency
133 in the operations of issuers, NIST provides guidelines for the accreditation of PIV Card
134 issuers and derived PIV credential issuers in [\[SP 800-79\]](#). The Standard also covers
135 security and interoperability requirements for PIV Cards. For this purpose, NIST has
136 established the PIV Validation Program, which tests implementations for conformance
137 with this Standard as specified in [\[SP 800-73\]](#) and [\[SP 800-78\]](#) (see [Appendix A.3](#)).

138 FIPS 201 compliance of PIV components and subsystems is provided in accordance
139 with OMB [\[M-19-17\]](#) through products and services from the U.S. General Services
140 Administration's (GSA) Interoperability Test Program and Approved Products and
141 Services List (see [Appendix A.5](#)). Implementation guidance for PIV-enabled federal
142 facilities and information systems in accordance with OMB [\[M-19-17\]](#) will be outlined
143 by [\[FICAM\]](#) as playbooks and best practice repositories. See also [\[SP 800-116\]](#) and
144 [\[ISC-RISK\]](#).

145 **8. Patents.** Aspects of the implementation of this Standard may be covered by U.S. or
146 foreign patents.

147 **9. Effective Date.** This Standard will be effective immediately upon final publication
148 of this revision, superseding FIPS 201-2. Features of this Standard that depend upon the
149 release of new or revised NIST Special Publications, including features that are optional,
150 deprecated, or removed, are effective upon final publication of the supporting Special
151 Publications.

152 **10. Specifications.** Federal Information Processing Standards (FIPS) 201 Personal
153 Identity Verification (PIV) of Federal Employees and Contractors.

154 **11. Qualifications.** The security provided by the PIV system is dependent on many
155 factors outside the scope of this Standard. Organizations must be aware that the overall
156 security of the personal identification system relies on

- 157 • assurance provided by the issuer of an identity credential that the individual in
158 possession of the credential has been correctly identified;
- 159 • protection provided to an identity credential stored within the PIV Card and
160 transmitted between the card and the PIV issuance and relying subsystems;
- 161 • infrastructure protection provided for derived PIV credential in the binding,
162 maintenance and use of the identity credential; and
- 163 • protection provided to the identity verification system infrastructure and
164 components throughout the entire lifecycle.

165 Although it is the intent of this Standard to specify mechanisms and support systems that
166 provide high assurance personal identity verification, conformance to this Standard does
167 not assure that a particular implementation is secure. It is the implementer's responsibility
168 to ensure that components, interfaces, communications, storage media, managerial
169 processes, and services used within the identity verification system are designed and
170 built in a secure manner.

171 Similarly, the use of a product that conforms to this Standard does not guarantee the
172 security of the overall system in which the product is used. The responsible authority
173 in each department and agency must ensure that an overall system provides the acceptable
174 level of security.

175 Because a standard of this nature must be flexible enough to adapt to advancements and
176 innovations in science and technology, NIST has a policy to review this Standard within
177 five years to assess its adequacy.

178 **12. Waiver Procedure.** FISMA does not allow for waivers to a FIPS that is made
179 mandatory by the Secretary of Commerce.

180 **13. Where to Obtain Copies of the Standard.** This publication is available through
181 the internet by accessing <https://csrc.nist.gov/publications/>. Other computer security
182 publications are available at the same website.

1. Introduction

This section is informative except where otherwise marked as normative. It provides background information for understanding the scope of this Standard.

Authentication of an individual's identity is a fundamental component of both physical and logical access control. An access control decision must be made when an individual attempts to access security-sensitive buildings, information systems, and applications. An accurate determination of an individual's identity supports making sound access control decisions.

In the past, a wide range of legacy mechanisms has been employed to authenticate an individual, utilizing various classes of identity credentials. For physical access, an individual's identity has been authenticated using paper or other non-automated, hand-carried credentials such as badges and driver's licenses. For logical access, authorization to access computers and data has been based on identities authenticated through user-selected passwords. Today, cryptographic mechanisms and biometric techniques are replacing these legacy mechanisms in physical and logical security applications. The strength of authentication that is achieved depends on the type of credential, the process used to issue the credential, and the authentication mechanism used to validate the credential.

This document establishes a standard for a Personal Identity Verification (PIV) system that meets the control and security objectives of [HSPD-12]. The Standard specifies implementation and processes for binding identities to authenticators, such as integrated circuit cards and derived credentials used in the federal PIV system. It is based on secure and reliable forms of identity credentials issued by the Federal Government to its employees and contractors. These credentials are intended to authenticate individuals who require access to federally controlled facilities, information systems, and applications. This Standard addresses requirements for initial identity proofing, infrastructure to support interoperability of identity credentials, and accreditation of organizations and processes issuing PIV credentials.

1.1 Purpose

This Standard defines reliable, government-wide identity credentials for use in applications such as access to federally controlled facilities and information systems. This Standard has been developed within the context and constraints of federal laws, regulations, and policies based on currently available and evolving information processing technology.

This Standard specifies a PIV system within which common identity credentials can be created and later used to verify a claimed identity. The Standard also identifies federal

346 government-wide requirements for security levels that are dependent on risks to federal
347 facilities or information being protected.

348 1.2 Scope

349 [HSPD-12], signed by President George W. Bush on August 27, 2004, established
350 the requirements for a common identification standard for identity credentials issued
351 by federal departments and agencies to federal employees and contractors (including
352 contractor employees) for gaining physical access to federally controlled facilities
353 and logical access to federally controlled information systems. HSPD-12 directs the
354 Department of Commerce to develop a Federal Information Processing Standards (FIPS)
355 publication to define such common identity credentials. In accordance with HSPD-12,
356 this Standard defines the following technical requirements for these identity credentials:

- 357 • They are issued based on sound criteria for verifying an individual employee's
358 identity.
- 359 • They are strongly resistant to identity fraud, tampering, counterfeiting, and terrorist
360 exploitation.
- 361 • They can be rapidly authenticated electronically.
- 362 • They are issued only by providers whose reliability has been established by an
363 official accreditation process.

364 Upon enrollment, a collection of records known as a PIV account is created and managed
365 within the issuer's enterprise identity management system (IDMS). The PIV account
366 includes the attributes of the PIV cardholder, the enrollment data, and information
367 regarding the PIV Card and any derived PIV credentials bound to the account.

368 This Standard defines authentication mechanisms that offer varying degrees of security
369 for both logical and physical access applications. Federal departments and agencies
370 will determine the level of security and authentication mechanisms appropriate for
371 their applications. The scope of this Standard is limited to the authentication of an
372 individual's identity. Authorization and access control decisions are outside of the scope
373 of this Standard. Moreover, requirements for a temporary credential used until a new or
374 replacement PIV credential arrives are out of the scope of this Standard.

375 While this Standard remains predominantly focused on PIV Cards, derived PIV
376 credentials and federation protocols also play important roles in the use of PIV accounts.
377 Section 2.10 of this Standard defines mechanisms for derived PIV credentials associated
378 with an active PIV account. Derived PIV credentials have authentication and lifecycle
379 requirements that may differ from the PIV Card itself. This Standard also discusses
380 federation protocols in Section 7 as a means of accepting PIV credentials issued by other
381 agencies. See Section 3 for more information on components of the PIV system.

382 **1.3 Change Management**

383 Every revision of this Standard introduces refinements and changes that may impact
384 existing implementations. FIPS 201 and associated normative specifications encourage
385 implementation approaches that reduce the high cost of configuration and change
386 management by architecting resilience to change into system processes and components.
387 Nevertheless, changes and modifications are required over time.

388 This section provides change management principles and guidance to implementers of
389 relying systems to manage newly introduced changes and modifications to the previous
390 version of this Standard.

391 **1.3.1 Backward Compatible Change**

392 A backward compatible change is a change or modification to an existing feature that
393 does not break relying systems using the feature. For example, changing the card
394 authentication certificate from optional to mandatory does not affect the systems using the
395 card authentication certificate for authentication (i.e., using the PKI-CAK authentication
396 mechanism).

397 **1.3.2 Backward Incompatible Change**

398 A backward incompatible change is a change or modification to an existing feature such
399 that the modified feature cannot be used with existing relying systems. For example,
400 changing the format of the biometric data records would not be compatible with the
401 existing system because a biometric authentication attempt with the modified format
402 would fail. Similarly, all systems interacting with the PIV Card would need to change if
403 the PIV Card Application Identifier (AID) changed (defined in [SP 800-73]), indicating a
404 backward incompatible change.

405 **1.3.3 New Features**

406 New features are features that are added to the Standard. These features can be optional
407 or mandatory. New features do not interfere with backward compatibility because they
408 are not part of the existing relying systems. For example, the optional biometric on-
409 card comparison (OCC) authentication mechanism (OCC-AUTH) was a new feature
410 introduced in FIPS 201-2. The optional mechanism did not affect the features of existing
411 systems. Systems had to be updated only if an agency decided to support the OCC-AUTH
412 mechanism.

413 **1.3.4 Deprecated and Removed Features**

414 *This subsection is normative.*

415 When a feature is to be discontinued or is no longer needed, it is deprecated. In general,
416 a feature that is currently in use by relying systems would only be deprecated if there
417 were a compelling reason to do so (e.g., security). Deprecated features MAY continue
418 to be used but SHOULD be phased out in future systems since the feature will likely
419 be removed in the next revision of the Standard. Removed features SHALL NOT be
420 used. For example, the CHUID authentication mechanism ([Section 6.2.5](#)) has been
421 removed from this version of the Standard and relying systems SHALL NOT use this
422 authentication mechanism.¹ The PIV Visual Credentials (VIS) authentication mechanism
423 ([Section 6.2.6](#)) has been deprecated as a stand-alone authentication mechanism, but it
424 MAY still be used in conjunction with other authentication mechanisms.

425 In the case of deprecated features on PIV Cards such as the magnetic stripe
426 ([Section 4.1.4.4](#)), existing PIV Cards with the deprecated features remain valid. However,
427 new PIV Cards SHOULD NOT include the deprecated features.

428 **1.3.5 FIPS 201 Version Management**

429 Subsequent revisions of this Standard may necessitate FIPS 201 version management that
430 introduces new version numbers for FIPS 201 products. Components that may be affected
431 by version management include but are not limited to PIV Cards, PIV middleware
432 software, and card issuance systems.

433 New version numbers will be assigned in [[SP 800-73](#)], if needed, based on the nature
434 of the change. For example, new mandatory features introduced in a revision of this
435 Standard may necessitate a new PIV Card Application version number so that systems
436 can quickly discover the new mandatory features. Optional features may be discoverable
437 by an on-card discovery mechanism.

438 **1.3.6 Section Number Stability**

439 Section numbers have not been changed in this revision. Any deleted sections have had
440 their contents removed and replaced with a removal notice while retaining the section
441 header and number. New subsections have been added at the end of their respective
442 sections with a new subsection number.

¹The CHUID data element has not been removed and continues to be mandatory.

1.4 Document Organization

This Standard describes the minimum requirements for a federal personal identity verification system that meets the control and security objectives of [HSPD-12], including identity proofing, registration, and issuance. It provides detailed technical specifications to support the control and security objectives of [HSPD-12] as well as interoperability among federal departments and agencies. This Standard describes the policies and minimum requirements of a PIV Card and derived PIV credentials that allow interoperability of credentials for physical and logical access. It specifies the use of federation protocols as a means of accepting PIV Card credentials and derived PIV credentials issued by other agencies. The physical card characteristics, storage media, and data elements that make up identity credentials are specified in this Standard. The interfaces and card architecture for storing and retrieving identity credentials from a smart card are specified in [SP 800-73]. Similarly, the requirements for collection, formatting, and use of biometric data records are specified in [SP 800-76]. The requirements for cryptographic algorithms are specified in [SP 800-78]. The requirements for the accreditation of PIV Card issuers are specified in [SP 800-79]. The unique organizational codes for federal agencies are assigned in [SP 800-87]. The requirements for PIV Card readers are provided in [SP 800-96]. The format for encoding PIV enrollment records for import and export is specified in [SP 800-156]. The requirements for issuing derived PIV credentials are specified in [SP 800-157].

This Standard contains normative references to other documents. Should normative text in this Standard conflict with normative text in a referenced document, the normative text in this Standard prevails for this Standard.

All sections in this document indicate whether they are *normative* (i.e., provide requirements for compliance) or *informative* (i.e., provide information details that do not affect compliance). This document is structured as follows:

- **Section 1, Introduction**, provides background information for understanding the scope of this Standard. This section is *informative* unless otherwise marked as *normative*.
- **Section 2, Common Identification, Security, and Privacy Requirements**, outlines the requirements for identity proofing, registration, and issuance, by establishing the control and security objectives for compliance with [HSPD-12]. This section is *normative*.
- **Section 3, PIV System Overview**, provides an overview of the different components of the PIV system. This section is *informative*.
- **Section 4, PIV Front-End Subsystem**, provides the requirements for the components of the PIV front-end subsystem. It defines requirements for the PIV Card, logical data elements, biometric data records, cryptography, and card readers. This section is *normative*.

- 482 • **Section 5, PIV Key Management Requirements**, defines the processes and
483 components required for managing a PIV Card's lifecycle. It also provides the
484 requirements and specifications related to key management. This section is
485 *normative*.
- 486 • **Section 6, PIV Cardholder Authentication**, defines a suite of authentication
487 mechanisms that are supported by the PIV Card and their applicability in meeting
488 the requirements of graduated levels of identity assurance. This section is
489 *normative*.
- 490 • **Section 7, Federation**, defines a set of mechanisms for using federation technologies
491 to interoperate with PIV credentials issued by other agencies. This section is
492 *normative*.
- 493 • **Appendix A, PIV Validation, Certification, and Accreditation**, provides additional
494 information regarding compliance with this document. This appendix is *normative*.
- 495 • **Appendix B, PIV Object Identifiers and Certificate Extension**, provides additional
496 details for the PIV objects identified in Section 4. This appendix is *normative*.
- 497 • **Appendix C, Glossary of Terms, Acronyms, and Notations**, describes the
498 vocabulary and textual representations used in the document. This appendix is
499 *informative*.
- 500 • **Appendix D, References**, lists the specifications and standards referred to in this
501 document. This appendix is *informative*.
- 502 • **Appendix E, Revision History**, lists changes made to this Standard from its
503 inception. This appendix is *informative*.

2. Common Identification, Security, and Privacy Requirements

This section is normative. It addresses the fundamental control and security objectives outlined in [HSPD-12], including the identity proofing requirements for federal employees and contractors.

2.1 Control Objectives

[HSPD-12] establishes control objectives for secure and reliable identification of federal employees and contractors. These control objectives, provided in paragraph 3 of the directive, are quoted here:

(3) “Secure and reliable forms of identification” for purposes of this directive means identification that (a) is issued based on sound criteria for verifying an individual employee’s identity; (b) is strongly resistant to identity fraud, tampering, counterfeiting, and terrorist exploitation; (c) can be rapidly authenticated electronically; and (d) is issued only by providers whose reliability has been established by an official accreditation process.

Each agency’s PIV implementation SHALL meet the four control objectives (a) through (d) listed above such that

- A credential is issued only to an individual whose identity has been verified and who has been appropriately vetted as per Section 2.2 after a proper authority has authorized issuance of the credential.
- A credential is issued only after an individual’s eligibility has been favorably adjudicated based on the prerequisite federal investigation (See Section 2.2). If there is no investigation meeting the investigative standards, the PIV credential eligibility may be approved upon favorable initiation of the prerequisite investigation² and once the Federal Bureau of Investigation (FBI) National Criminal History Check (NCHC) portion of the background investigation is completed and favorably adjudicated.
- An individual is issued a credential only after presenting two identity source documents, at least one of which is a Federal or State Government-issued picture ID.
- Fraudulent identity source documents are not accepted as genuine or unaltered.

²The initiation of a background investigation is defined as the submission of an investigative request to the Defense Counterintelligence and Security Agency or other authorized federal investigative service provider.

- 534 • A person suspected or known to the government as being a terrorist is not issued a
535 credential.
- 536 • No substitution occurs in the identity proofing process. More specifically, the
537 individual who appears for identity proofing and whose fingerprints are checked
538 against databases is the person to whom the credential is issued.
- 539 • No credential is issued unless requested by the proper authority.
- 540 • A credential remains serviceable only up to its expiration date. More precisely, a
541 revocation process exists such that expired or invalidated credentials are swiftly
542 revoked.
- 543 • A single corrupt official in the process may not issue a credential with an incorrect
544 identity or to a person not entitled to the credential.
- 545 • An issued credential is not duplicated or forged.
- 546 • An issued credential is not modified by an unauthorized entity.

547 **2.2 Credentialing Requirements**

548 Federal departments and agencies SHALL use the credentialing eligibility standards
549 issued by the Director of the Office of Personnel Management (OPM)³ and OMB.⁴

550 Federal departments and agencies must follow investigative requirements established
551 by the Suitability and Credentialing Executive Agent and the Security Executive
552 Agent. Departments and agencies SHALL use position designation guidance issued
553 by the Executive Agents. The designation of the position determines the prerequisite
554 investigative requirement. Individuals being processed for a PIV Card SHALL receive
555 the required investigation and are subject to any applicable reinvestigation or continuous
556 vetting requirements to maintain their PIV eligibility.

557 The minimum requirement for PIV Credential eligibility determination is a completed and
558 favorably adjudicated Tier 1 investigation, formerly called a National Agency Check with
559 Written Inquiries (NACI).⁵

560 Before an individual is determined eligible to be issued a PIV Card when no
561 corresponding prior investigation exists, the appropriate required investigation SHALL
562 be initiated with the authorized federal investigative service provider and the FBI NCHC
563 portion of the background investigation SHALL be completed and favorably adjudicated.

564 Once the investigation is completed, the authorized adjudicative entity SHALL adjudicate
565 the investigation and report the final eligibility determination to the Central Verification

³For example, [FCS] and the Federal Investigative Standards or subsequent standards.

⁴For example, OMB [M-05-24].

⁵NACI investigations were replaced with Tier 1 investigations upon implementation of the 2012 Federal Investigative Standards.

566 System (or successor). This determination SHALL be recorded in the PIV enrollment
567 record to reflect PIV eligibility for the PIV cardholder and, if applicable, their enrollment
568 in the Continuous Vetting Program.

569 For full guidance on PIV credentialing investigative and adjudicative requirements,
570 issuers must work closely with their personnel security/suitability offices to ensure
571 adherence to the latest federal personnel vetting guidance as provided by the Executive
572 Agents.

573 **2.3 Biometric Data Collection for Background Investigations**

574 A full set of fingerprints SHALL be collected from each PIV applicant.

575 Biometric identification using fingerprints is the primary input to law enforcement checks.
576 In cases where ten fingerprints are not available, then as many fingers as possible SHALL
577 be imaged as per guidance in [SP 800-76]. In cases where no fingers are available to
578 be imaged, agencies SHALL seek guidance from their respective investigative service
579 provider for alternative means of performing law enforcement checks.

580 This collection is not necessary for applicants who have a completed and favorably
581 adjudicated Tier 1 or higher federal background investigation on record that can be
582 located and referenced.

583 Fingerprint collection SHALL conform to the procedural and technical specifications of
584 [SP 800-76].

585 **2.4 Biometric Data Collection for PIV Card**

586 The following biometric data SHALL be collected from each PIV applicant:

- 587 • Two fingerprints for off-card one-to-one comparison. These fingerprints MAY be
588 taken from the full set of fingerprints collected in [Section 2.3](#).
- 589 • An electronic facial image.

590 The following biometric data MAY be collected from a PIV applicant:

- 591 • An electronic image of the left iris.
- 592 • An electronic image of the right iris.
- 593 • Two fingerprints for on-card comparison (OCC). These fingerprints MAY be taken
594 from the full set of fingerprints collected in [Section 2.3](#) and SHOULD be imaged
595 from fingers not imaged for off-card one-to-one comparison.

596 If the identity proofing and enrollment process is performed over multiple visits, a
597 biometric verification attempt comparing the applicant's newly captured biometric
598 characteristics against biometric data collected during a previous visit SHALL be
599 performed at each visit and return a positive verification decision.

600 If collection of biometric data as specified in this section and in [Section 2.3](#) occur on
601 separate occasions, a biometric comparison SHALL be performed to confirm that the
602 two fingerprints collected for off-card one-to-one comparisons elicit a positive biometric
603 verification decision when compared to the same two fingerprints from the original set of
604 ten fingerprints.

605 Biometric data collection SHALL conform to the procedural and technical specifications
606 of [\[SP 800-76\]](#). The choice of fingers to use for mandatory fingerprint templates and
607 optional fingerprint templates MAY vary between persons. The recommended selection
608 and order is specified in [\[SP 800-76\]](#).

609 **2.5 Biometric Data Use**

610 The full set of fingerprints SHALL be used for biometric identification against databases
611 of fingerprints maintained by the FBI.

612 The two mandatory fingerprints SHALL be used for the preparation of biometric
613 templates to be stored on the PIV Card as described in [Section 4.2.3.1](#). The fingerprints
614 provide an interoperable authentication mechanism through an off-card comparison
615 scheme (BIO or BIO-A) as described in [Section 6.2.1](#). These fingerprints are also the
616 primary means of authentication during PIV issuance and maintenance processes.

617 The optional fingerprints MAY be used for the preparation of biometric templates for
618 OCC as described in [Section 4.2.3.1](#). OCC MAY be used to support card activation as
619 described in [Section 4.3.1](#). OCC MAY also be used for cardholder authentication (OCC-
620 AUTH) as described in [Section 6.2.2](#).

621 Agencies MAY choose to collect electronic iris images as an additional biometric
622 characteristic. If collected, the electronic iris images SHALL be stored on the PIV Card
623 as described in [Section 4.2.3.1](#). The images MAY be used for cardholder authentication
624 (BIO or BIO-A) as described in [Section 6.2.1](#). Electronic iris images are an additional
625 means of authentication during PIV issuance and maintenance processes when fingerprint
626 biometric data records are unavailable.

627 The electronic facial image SHALL be stored on the PIV Card as described in
628 [Section 4.2.3.1](#). It SHALL be printed on the PIV Card according to [Section 4.1.4.1](#).
629 The image MAY be used for cardholder authentication (BIO or BIO-A) as described in
630 [Section 6.2.1](#). It MAY be retrieved and displayed on guard workstations to augment other
631 authentication processes from [Section 6.2](#). The electronic facial image is a secondary

632 means of authentication during operator-attended PIV issuance and maintenance
633 processes when fingerprint biometric data records are unavailable.

634 PIV background investigation, identity proofing, registration, and issuance processes
635 MAY be performed across multiple sessions at different facilities. If multiple sessions are
636 needed, the applicant SHALL be linked through a positive biometric verification decision
637 by comparing biometric characteristics captured at a previous session with biometric
638 characteristics captured during the current session. Issuers SHALL follow applicable
639 federal laws and regulations regarding the retention and destruction of biometric data.

640 **2.6 PIV Enrollment Records**

641 Note: This section was formerly entitled “Chain-of-Trust”.

642 A card issuer SHALL maintain the enrollment record for each issued PIV Card. These
643 enrollment records are created and maintained through the methods of contemporaneous
644 acquisition at each step of the PIV issuance process—typically including identity
645 proofing, registration and biometric enrollment—and are generally stored as part of the
646 cardholder’s PIV account.

647 PIV enrollment records maintain an auditable sequence of enrollment events to facilitate
648 binding an applicant to multiple transactions that might take place at different times and
649 locations.⁶

650 PIV enrollment records SHOULD include the following data:

- 651 • A log of activities that documents who took the action, what action was taken, when
652 and where the action took place, and what data was collected.
- 653 • An enrollment data record that contains the most recent collection of each of the
654 biometric data collected. The enrollment data record describes the circumstances
655 of biometric acquisition including the name and role of the acquiring agent, the
656 office and organization, time, place, and acquisition method. The enrollment data
657 record MAY also document unavailable biometric data or failed attempts to collect
658 biometric data. The enrollment data record MAY contain historical biometric data
659 records.
- 660 • The most recent unique identifiers issued to the individual, such as the Federal
661 Agency Smart Credential Number (FASC-N) and the card Universally Unique
662 Identifier (UUID). The record MAY contain historical unique identifiers.

⁶For example, ten fingerprints for law enforcement checks may be collected at one time and place, and two fingerprints for PIV Card templates may be collected at a later time and different place, provided that a biometric comparison confirms that the two fingerprints belong to the original set of ten fingerprints.

- 663 • Information about the authorizing entity who has approved the issuance of a
664 credential.
- 665 • Current status of the background investigation, including the results of the
666 investigation once completed.
- 667 • The evidence of authorization if the credential is issued under a pseudonym.
- 668 • Any data or any subsequent changes in the data about the cardholder. If the changed
669 data is the cardholder's name, then the issuer SHOULD include the evidence of a
670 formal name change.

671 The biometric data records in the PIV enrollment records SHALL be valid for a
672 maximum of 12 years. In order to mitigate aging effects and thereby maintain operational
673 readiness of a cardholder's PIV Card, agencies MAY require biometric enrollment more
674 frequently than 12 years.

675 PIV enrollment records contain Personally Identifiable Information (PII). PII SHALL be
676 protected in a manner that protects the individual's privacy and maintains the integrity of
677 the records both in transit and at rest.

678 To facilitate interoperability between PIV issuers, systems may import and export
679 enrollment records in the manner and representation described in [SP 800-156].

680 PIV enrollment records can be applied in several situations, including the following:

681 **Extended enrollment**

682 A PIV applicant enrolls a full set of fingerprints for background investigations at one
683 place and time and two fingerprints for the PIV Card at another place and time. The
684 enrollment record would contain identifiers and two enrollment data records: one with
685 the full set of fingerprint images collected for background investigations and one with
686 two fingerprint templates collected for the PIV Card. The two fingerprint templates
687 would be compared to the corresponding fingers in the ten-fingerprint data set in the
688 PIV enrollment record.

689 **Reissuance**

690 A PIV cardholder loses their card. Since the card issuer has biometric data records
691 from enrollment, the cardholder can perform a biometric comparison against
692 the biometric data stored in the PIV enrollment record. The card issuer NEED
693 NOT repeat the identity proofing and registration process on a positive biometric
694 verification decision. Instead, the card issuer revokes the lost card and proceeds to
695 issue a new card as described in [Section 2.9.1](#).

696 **Interagency transfer**

697 A federal employee is transferred from one agency to another. When the employee
698 leaves the old agency, they surrender their PIV Card and it is destroyed. When the
699 employee arrives at the new agency and is processed in, the card issuer in the new

700 agency requests and receives the employee's PIV enrollment record from the card
701 issuer in the old agency. The employee performs a biometric comparison against
702 the biometric data stored in this record, and the interaction proceeds as described in
703 [Section 2.8.2](#).

704 **2.7 PIV Identity Proofing and Registration Requirements**

705 Identity proofing and registration requirements for the issuance of PIV Cards meet
706 Identity Assurance Level (IAL) 3 since they follow a tailored process based on
707 [\[SP 800-63A\]](#) IAL3 requirements. Departments and agencies SHALL follow an identity
708 proofing and registration process that meets the requirements defined below when issuing
709 PIV Cards.

710 The organization SHALL adopt and use an identity proofing and registration process that
711 is approved in accordance with [\[SP 800-79\]](#).

712 The organization SHALL follow investigative requirements as outlined in [Section 2.2](#).

713 Biometric data SHALL be captured as specified in [Section 2.3](#) and [Section 2.4](#).

714 The applicant SHALL appear in person at least once before the issuance of a PIV Card,
715 either at the issuing facility or at a supervised remote identity proofing station (as
716 described in [Section 2.7.1](#)).

717 During identity proofing, the applicant SHALL be required to provide two original forms
718 of identity source documents.⁷ These documents SHALL be validated to ensure they
719 are genuine and authentic, not counterfeit, fake, or forgeries. Validation of physical
720 security features SHALL be performed by trained staff. When they are available,
721 cryptographic security features SHOULD be used to validate evidence. The identity
722 source documents SHALL be bound to the applicant and SHALL NOT be expired or
723 cancelled. If the two identity source documents bear different names, evidence of a
724 formal name change SHALL be provided. At least one identity source document SHALL
725 meet the requirements of Strong evidence as specified in [\[SP 800-63A\]](#) and be one of the
726 following forms of identification:

- 727 • U.S. Passport or a U.S. Passport Card
- 728 • Permanent Resident Card or Alien Registration Receipt Card (Form I-551)
- 729 • foreign passport
- 730 • Employment Authorization Document that contains a photograph (Form I-766)

⁷Departments and agencies may choose to accept only a subset of the identity source documents listed in this section. For example, in cases where identity proofing for PIV Card issuance is performed prior to verification of employment authorization, departments and agencies may choose to require the applicant to provide identity source documents that satisfy the requirements of Form I-9, *Employment Eligibility Verification*, in addition to the requirements specified in this section.

- 731 • driver's license or ID card that is compliant with [REAL-ID] enforcement
- 732 requirements pursuant to DHS regulations
- 733 • U.S. Military ID card
- 734 • U.S. Military dependent's ID card
- 735 • PIV Card

736 The second piece of evidence MAY be from the list above, but it SHALL NOT be of
 737 the same type as the primary identity source document.⁸ The second identity source
 738 document MAY also be one of the following:

- 739 • ID card issued by a federal, state, or local government agency or entity, provided
- 740 that it contains a photograph
- 741 • voter's registration card
- 742 • U.S. Coast Guard Merchant Mariner Card
- 743 • Certificate of U.S. Citizenship (Form N-560 or N-561)
- 744 • Certificate of Naturalization (Form N-550 or N-570)
- 745 • U.S. Citizen ID Card (Form I-197)
- 746 • Identification Card for Use of Resident Citizen in the United States (Form I-179)
- 747 • Certification of Birth Abroad or Certification of Report of Birth issued by the
- 748 Department of State (Form FS-545 or Form DS-1350)
- 749 • Reentry Permit (Form I-327)
- 750 • Employment authorization document issued by the Department of Homeland
- 751 Security (DHS)
- 752 • driver's license issued by a Canadian government entity
- 753 • Native American tribal document
- 754 • U.S. Social Security Card issued by the Social Security Administration
- 755 • original or certified copy of a birth certificate issued by a state, county, municipal
- 756 authority, possession, or outlying possession of the United States bearing an official
- 757 seal
- 758 • another piece of evidence that meets the requirements of Fair evidence specified in
- 759 [SP 800-63A]

760 Note: One piece of Strong evidence and one other piece of evidence meeting
 761 the requirements of Fair evidence in [SP 800-63A] are considered sufficient
 762 for issuance of a PIV Card because the requirement for a federal background
 763 investigation is considered a compensating control for identity proofing at
 764 IAL3.

⁸For example, if the first source document is a foreign passport (e.g., Italy), the second source document cannot be another foreign passport (e.g., France).

765 The PIV identity proofing, registration, issuance, and reissuance processes SHALL
766 adhere to the principle of separation of duties to ensure that no single individual has the
767 capability to issue a PIV Card without the cooperation of another authorized person.

768 The identity proofing and registration process used when verifying the identity of
769 the applicant SHALL be accredited by the department or agency as satisfying the
770 requirements above and approved in writing by the head or deputy (or equivalent) of
771 the federal department or agency.

772 The requirements for identity proofing and registration also apply to citizens of foreign
773 countries who are working for the Federal Government overseas. However, a process for
774 identity proofing and registration SHALL be established using a method approved by the
775 U.S. Department of State's Bureau of Diplomatic Security, except for employees under the
776 command of a U.S. area military commander. These procedures vary depending on the
777 country.

778 **2.7.1 Supervised Remote Identity Proofing**

779 Departments and agencies MAY use a supervised remote identity proofing process for the
780 issuance of PIV Cards. This process involves the use of an issuer-controlled station at a
781 remote location that is connected to a trained operator at a central location. The goal of
782 this arrangement is to permit identity proofing of individuals in remote locations where it
783 is not practical for them to travel to the agency for in-person identity proofing.

784 Supervised remote identity proofing takes advantage of improvements in sensor
785 technology (e.g., cameras and biometric capture devices) and communications bandwidth
786 to closely duplicate the security of in-person identity proofing. This is done through the
787 use of specialized equipment to support an enrollment station that is under the control of
788 either the issuer or a third party that is trusted by the issuer.

789 The following forms of protection SHALL be provided by either inherent capabilities of
790 the station or staff at the station location:

- 791 • ensuring that only the applicant interacts with the station during any session;
- 792 • ensuring that the physical integrity of the station and its sensors is maintained at all
793 times; and
- 794 • reporting any problems with the station to the issuer.

795 Supervised remote identity proofing SHALL meet the following requirements:

- 796 • The station SHALL be maintained in a controlled-access environment and SHALL
797 be monitored by staff at the station location while it is being used.⁹

⁹A controlled-access environment is a location with limited egress points where staff can see the station while performing other duties.

- 798 • The issuer SHALL have a live operator participate remotely with the applicant for
799 the entirety of the identity proofing session.
- 800 • The issuer SHALL require operators to have undergone a training program to
801 detect potential fraud and to properly perform a supervised remote identity proofing
802 session.
- 803 • The operator SHALL monitor the entire identity proofing session—from which the
804 applicant SHALL NOT depart—by at least one continuous, high-resolution video
805 transmission of the applicant.
- 806 • The operator SHALL require all actions taken by the applicant during the identity
807 proofing session to be clearly visible to the operator.
- 808 • The operator SHALL validate the physical or cryptographic security features of
809 primary and secondary identity source documents using scanners and sensors that
810 are integrated into the station.
- 811 • The issuer SHALL ensure that all communications occur over a mutually
812 authenticated protected channel.

813 If biometric data cannot be collected per the criteria defined in [SP 800-76] or if
814 validation of the identity evidence is inadequate, supervised remote identity proofing
815 SHALL NOT be used and the identity proofing and enrollment shall be performed in
816 person at the issuer’s facility. The trained operator SHALL terminate a supervised remote
817 identity proofing session and require in-person identity proofing at an issuing facility if
818 there is reasonable basis to believe¹⁰ that the applicant is attempting to bypass protection
819 capabilities of the station.

820 2.8 PIV Card Issuance Requirements

821 Departments and agencies SHALL meet the requirements defined below when issuing
822 PIV Cards. The issuance process used when issuing PIV Cards SHALL be accredited by
823 the department or agency as satisfying the requirements below and approved in writing by
824 the head or deputy (or equivalent) of the federal department or agency.

- 825 • PIV Cards SHALL be issued only after the adjudicative entity has authorized
826 issuance of the credential.
- 827 • The organization SHALL use an approved PIV credential issuance process in
828 accordance with [SP 800-79].
- 829 • Before issuing the PIV Card, the issuer SHALL ensure that the individual receiving
830 it has been properly processed per Section 2.1, Section 2.2, and Section 2.7.
- 831 • Biometric data used to personalize the PIV Card SHALL be those captured during
832 the identity proofing and registration process.

¹⁰A reasonable basis to believe occurs when a disinterested observer with knowledge of the same facts and circumstances would reasonably reach the same conclusion.

- 833 • During the issuance process, the issuer SHALL verify that the individual to whom
834 the PIV Card is to be issued is the same as the intended applicant/recipient as
835 approved by the appropriate authority. Before the PIV Card is provided to the
836 applicant, the issuer SHALL perform a one-to-one comparison of the applicant
837 against biometric data records available on the PIV Card or in the PIV enrollment
838 record. The one-to-one comparison requires either a comparison of fingerprints or,
839 if unavailable, other optional biometric data records that are available. Minimum
840 accuracy requirements for the biometric verification are specified in [SP 800-76].
841 On a positive biometric verification decision, the PIV Card SHALL be released to
842 the applicant. If the biometric verification decision is negative, or if no biometric
843 data records are available, the cardholder SHALL provide two identity source
844 documents (as specified in Section 2.7), and an attending operator SHALL inspect
845 these and compare the cardholder with the photograph printed on the PIV Card.
- 846 • The organization SHALL issue PIV credentials only through systems and providers
847 whose reliability has been established by the agency and so documented and
848 approved in writing (i.e., accredited) in accordance with [SP 800-79].
- 849 • The PIV Card SHALL be valid for no more than six years.

850 PIV Cards that contain topographical defects (e.g., scratches, poor color, fading, etc.) or
851 that are not properly printed SHALL be destroyed. The PIV Card issuer is responsible for
852 the card stock, its management, and its integrity.

853 2.8.1 Special Rule for Pseudonyms

854 In limited circumstances, federal employees and contractors are permitted to use
855 pseudonyms during the performance of their official duties with the approval of their
856 employing agency. If an agency determines that the use of a pseudonym is necessary¹¹
857 to protect an employee or contractor (e.g., from physical harm, severe distress, or
858 harassment), the agency may formally authorize the issuance of a PIV Card to the
859 employee or contractor using the agency-approved pseudonym. The issuance of a PIV
860 Card using an authorized pseudonym SHALL follow the procedures in Section 2.8
861 except that the card issuer SHALL receive satisfactory evidence that the pseudonym is
862 authorized by the agency.

863 2.8.2 Grace Period

864 In some instances, an individual's status as a federal employee or contractor will lapse
865 for a brief time period. For example, a federal employee may leave one federal agency for

¹¹An example can be seen in Section 10.5.7 of the Internal Revenue Service Manual (https://www.irs.gov/irm/part10/irm_10-005-007), which authorizes approval by an employee's supervisor of the use of a pseudonym to protect the employee's personal safety.

866 another federal agency and thus incur a short employment lapse period, or an individual
867 who was under contract to a federal agency may receive a new contract from that agency
868 shortly after the previous contract expired.¹² In these instances, the card issuer MAY issue
869 a new PIV Card without repeating the identity proofing and registration process if the
870 issuer can obtain the applicant's PIV enrollment record containing biometric data records
871 from the issuer of the applicant's previous PIV Card.

872 When issuing a PIV Card under the grace period, the card issuer SHALL verify that
873 PIV Card issuance has been authorized by a proper authority and that the employee or
874 contractor's background investigation is valid. Re-investigations SHALL be performed,
875 if required, in accordance with the federal investigative standards. At the time of
876 issuance, the card issuer SHALL perform biometric verification of the applicant to the
877 biometric data records in the applicant's previous PIV enrollment record. The one-to-one
878 comparison requires either a comparison of fingerprints or, if unavailable, other optional
879 biometric data records that are available. On a positive biometric verification decision,
880 the new PIV Card SHALL be released to the applicant. If the biometric verification
881 decision is negative, or if no biometric data records are available, the cardholder SHALL
882 provide two identity source documents (as specified in [Section 2.7](#)), and an attending
883 operator SHALL inspect these and compare the cardholder with the electronic facial
884 image retrieved from the enrollment data record and the photograph printed on the new
885 PIV Card.

886 **2.9 PIV Card Maintenance Requirements**

887 The PIV Card SHALL be maintained using processes that comply with this section.

888 The data and credentials held by the PIV Card may need to be updated or invalidated
889 prior to the expiration date of the card. For example, a previously issued PIV Card needs
890 to be invalidated when the cardholder changes their name or employment status. In this
891 regard, procedures for PIV Card maintenance must be integrated into department and
892 agency procedures to ensure effective card maintenance. In order to maintain operational
893 readiness of a cardholder's PIV Card, agencies may require PIV Card update, reissuance,
894 or biometric enrollment more frequently than the maximum PIV Card and biometric
895 characteristic lifetimes stated in this Standard. Shorter lifetimes MAY be specified by
896 agency policy.

897 **2.9.1 PIV Card Reissuance Requirements**

898 Reissuance is the process by which a new PIV Card is issued to a cardholder without the
899 need to repeat the entire identity proofing and registration process. The reissuance process

¹²For the purposes of this section, a lapse is considered to be brief if it is not long enough to require that a new or updated background investigation be performed consistent with Executive Agents' guidance.

900 may be used to replace a PIV Card that is nearing expiration, in the event of an employee
901 status or attribute change, or to replace a PIV Card that has been compromised, lost,
902 stolen, or damaged. The cardholder may also apply for reissuance of a PIV Card if one or
903 more logical credentials have been compromised. The identity proofing, registration, and
904 issuance processes, as described in [Section 2.7](#) and [Section 2.8](#), SHALL be repeated if the
905 issuer does not maintain a PIV enrollment record that includes biometric data records for
906 the cardholder.

907 If the expiration date of the new PIV Card is later than the expiration date of the old
908 card, or if any data about the cardholder is being changed, the card issuer SHALL ensure
909 that an adjudicative entity has authorized the issuance of the new PIV Card. The issuer
910 SHALL ensure that the adjudicative entity has verified that there is a PIV eligibility
911 determination in an authoritative record, such as the agency's IDMS or the Central
912 Verification System (or successor).

913 The issuer SHALL perform a biometric verification of the applicant to the biometric
914 data records obtained from either the PIV Card or PIV enrollment record. Minimum
915 accuracy requirements for the biometric verification are specified in [\[SP 800-76\]](#). On
916 a positive biometric verification decision, the new PIV Card SHALL be released to
917 the applicant. If the biometric verification decision is negative, or if no biometric data
918 records are available, the cardholder SHALL provide two identity source documents (as
919 specified in [Section 2.7](#)), and an attending operator SHALL inspect these and compare the
920 cardholder with the electronic facial image retrieved from the enrollment data record and
921 the photograph printed on the new PIV Card.

922 The old PIV Card SHALL be revoked when the new PIV Card is issued. The revocation
923 process SHALL include the following:

- 924 • The old PIV Card SHALL be collected and destroyed, if possible.
- 925 • Any databases maintained by the PIV Card issuer that contain FASC-N or card
926 UUID values from the old PIV Card must be updated to reflect the change in status.
- 927 • If the old PIV Card cannot be collected and destroyed, or if the old PIV Card has
928 been compromised or damaged, then the Certification Authority (CA) SHALL
929 be informed and the certificates corresponding to the PIV authentication key
930 ([Section 4.2.2.1](#)) and asymmetric card authentication key ([Section 4.2.2.2](#)) on the
931 old PIV Card SHALL be revoked. If present, the certificates corresponding to the
932 digital signature key ([Section 4.2.2.1](#)) and the key management key ([Section 4.2.2.5](#))
933 SHALL also be revoked.

934 In the case of a lost, stolen, or compromised card, normal revocation procedures SHALL
935 be completed within 18 hours of notification. In certain cases, 18 hours is an unacceptable
936 delay, and in those cases emergency procedures SHOULD be executed to disseminate the
937 information as rapidly as possible.

938 If there is any data change about the cardholder, the issuer SHALL record this data change
939 in the PIV enrollment record, if applicable. If the changed data is the cardholder's name,
940 then the issuer SHALL meet the requirements in [Section 2.9.1.1](#).

941 Previously collected biometric data MAY be reused with the new PIV Card if the
942 expiration date of the new PIV Card is no later than 12 years after the date that the
943 biometric data was obtained. As biometric system error rates generally increase with
944 the time elapsed since initial collection (reference aging, [\[ISO 2382-37\]](#)), issuers MAY
945 refresh biometric data in the PIV enrollment record during the re-issuance process. Even
946 if the same biometric data is reused with the new PIV Card, the digital signature must be
947 recomputed with the new FASC-N and UUID.

948 A new PIV authentication certificate and a new card authentication certificate SHALL be
949 generated. The corresponding certificates SHALL be populated with the new FASC-N
950 and card UUID. For cardholders who are required to have a digital signature certificate,
951 a new digital signature certificate SHALL also be generated. Key management keys and
952 certificates MAY be imported to the new PIV Card.

953 **2.9.1.1 Special Rule for Name Change by Cardholder**

954 Name changes frequently occur as a result of marriage, divorce, or as a matter of personal
955 preference. In the event that a cardholder notifies a card issuer that their name has
956 changed and presents the card issuer with evidence of a formal name change—such
957 as a marriage certificate, a divorce decree, judicial recognition of a name change, or
958 other mechanism permitted by state law or regulation—the card issuer SHALL issue
959 the cardholder a new card following the procedures set out in [Section 2.9.1](#) and notify the
960 respective adjudicative entity of the name change to ensure that appropriate records are
961 updated. If the expiration date of the new card is no later than the expiration date of the
962 old PIV Card and no data about the cardholder other than the cardholder's name is being
963 changed, then the new PIV Card MAY be issued without obtaining the approval of the
964 adjudicative entity and without performing a re-investigation.

965 **2.9.2 PIV Card Post-Issuance Update Requirements**

966 A PIV Card post-issuance update MAY be performed without replacing the PIV Card in
967 cases where none of the printed information on the surface of the card is changed. The
968 post-issuance update applies to cases where one or more certificates, keys, biometric data
969 records, or signed data objects are updated. A post-issuance update SHALL NOT modify
970 the PIV Card expiration date, FASC-N, card UUID, or cardholder UUID.

971 A PIV Card post-issuance update MAY be done locally (i.e., performed with the issuer
972 in physical custody of the PIV Card) or remotely (i.e., performed with the PIV Card at
973 a remote location). Post-issuance updates SHALL be performed with issuer security

974 controls equivalent to those applied during PIV Card reissuance. For remote post-
975 issuance updates, the following SHALL apply:

- 976 • Communication between the PIV Card issuer and the PIV Card SHALL occur
977 only over mutually authenticated secure sessions between tested and validated
978 cryptographic modules (one being the PIV Card).
- 979 • Data transmitted between the PIV Card issuer and PIV Card SHALL be encrypted
980 and contain data integrity checks.
- 981 • The PIV Card application SHALL communicate with no endpoint entity other than
982 the PIV Card issuer during the remote post-issuance update.

983 Post-issuance updates to biometric data records, other than to the digital signature
984 blocks within the biometric data records, SHALL satisfy the requirements for PIV Card
985 activation reset specified in [Section 2.9.3](#).

986 If the PIV authentication key ([Section 4.2.2.1](#)), asymmetric card authentication key
987 ([Section 4.2.2.2](#)), digital signature key ([Section 4.2.2.1](#)), or key management key
988 ([Section 4.2.2.5](#)) was compromised, the corresponding certificate SHALL be revoked.

989 **2.9.3 PIV Card Activation Reset**

990 The Personal Identification Number (PIN) on a PIV Card may need to be reset if the
991 cardholder has forgotten the PIN or if PIN-based cardholder authentication has been
992 disabled by the usage of an invalid PIN more than the allowed number of retries. A
993 maximum of 10 consecutive PIN retries SHALL be permitted unless a lower limit is
994 stipulated by the department or agency. Cardholders MAY change their PINs at any time
995 by providing the current PIN and the new PIN values. PIN reset MAY be performed in
996 person at an issuing facility, at a kiosk operated by the issuer, or remotely via a general
997 computing platform or a supervised remote identity proofing station:

998 **In person**

999 When PIN reset is performed in person at the issuing facility, before providing
1000 the reset PIV Card back to the cardholder, the issuer SHALL perform a biometric
1001 verification to ensure that the cardholder's biometric characteristics elicit a positive
1002 biometric verification decision when compared to biometric data records stored either
1003 on the PIV Card or in the PIV enrollment record. In cases where a negative biometric
1004 verification decision is returned or the cardholder's biometric characteristics are not
1005 successfully acquired, the cardholder SHALL provide the PIV Card to be reset and
1006 another primary identity source document (as specified in [Section 2.7](#)). An attending
1007 operator SHALL inspect these and compare the cardholder with the electronic facial
1008 image retrieved from the enrollment data record and the photograph printed on the
1009 card.

1010 Issuer-operated kiosk

1011 PIN reset at an issuer-operated kiosk SHALL ensure that the PIV Card is
1012 authenticated and that the cardholder's biometric characteristics elicit a positive
1013 biometric verification decision when compared to either the stored biometric on
1014 the PIV Card through an on-card one-to-one comparison or biometric data records
1015 stored in the PIV enrollment record through an off-card one-to-one comparison. If the
1016 biometric verification decision is negative, the cardholder's biometric characteristics
1017 are not successfully acquired, or card authentication is unsuccessful, the kiosk SHALL
1018 NOT reset the PIV Card. The session SHALL be terminated and the PIN reset
1019 SHALL be performed in person at the issuing facility or at a supervised remote
1020 identity proofing station. The kiosk MAY be unattended while used for PIN reset
1021 operations.

1022 Supervised remote identity proofing station

1023 PIN reset at a supervised remote identity proofing station combines the assurance
1024 of an in-person reset with the convenience of a kiosk reset. All protections and
1025 requirements of [Section 2.7.1](#) SHALL be observed during the procedure. The
1026 operator SHALL initiate a biometric verification to ensure that the cardholder's
1027 biometric characteristics captured at the station elicit a positive biometric verification
1028 decision when compared to biometric data records stored either on the PIV Card or in
1029 the PIV enrollment record. In cases where a negative biometric verification decision
1030 is returned or the cardholder's biometric characteristics are not successfully acquired,
1031 the cardholder SHALL provide the PIV Card to be reset and another primary identity
1032 source document (as specified in [Section 2.7](#)) via the scanners and sensors integrated
1033 into the station. The remote operator SHALL inspect these items and compare the
1034 video feed of the cardholder with the electronic facial image retrieved from the
1035 enrollment data record and the photograph printed on the PIV Card.

1036 General computing platform

1037 Remote PIN reset on a general computing platform (e.g., desktop, laptop) SHALL
1038 only be performed if all the following requirements are met:

- 1039 • The cardholder initiates a PIN reset with the issuer operator.
- 1040 • The operator authenticates the owner of the PIV Card through an independent
1041 procedure.
- 1042 • The cardholder's biometric characteristics elicit a positive biometric verification
1043 decision when compared to the stored biometric data records on the PIV Card
1044 through OCC.

1045 The remote PIN reset operation SHALL satisfy the requirements for remote, post-issuance
1046 updates specified in [Section 2.9.2](#).

1047 Regardless of the PIN reset procedure used, the chosen PIN SHALL meet the activation
1048 requirements specified in [Section 4.3.1](#).

1049 The PIV Card's activation methods for OCC may also be reset by the card issuer. Before
1050 the reset, the issuer SHALL perform a biometric verification of the cardholder to the
1051 biometric data records in the PIV enrollment record. If no alternative biometric data
1052 records are available, the cardholder SHALL provide the PIV Card to be reset and another
1053 primary identity source document (as specified in [Section 2.7](#)). An attending operator
1054 SHALL inspect these and compare the cardholder with the electronic facial image
1055 retrieved from the enrollment data record and the photograph printed on the PIV Card.

1056 Departments and agencies MAY adopt more stringent procedures for PIN/OCC reset
1057 (including disallowing resets); such procedures SHALL be formally documented by each
1058 department and agency.

1059 **2.9.4 PIV Card Termination Requirements**

1060 A PIV Card is terminated when the department or agency that issued the card determines
1061 that the cardholder is no longer eligible to have a PIV Card. The PIV Card SHALL be
1062 terminated under any of the following circumstances:

- 1063 • A federal employee separates (voluntarily or involuntarily) from federal service.
- 1064 • A contractor changes positions and no longer needs access to federal buildings or
1065 systems.
- 1066 • A cardholder passes away.
- 1067 • An authorized adjudicative entity determines that the cardholder is ineligible for a
1068 PIV Card after completion of a cardholder's background investigation or review of
1069 developed information (see [\[FCS\]](#)).
- 1070 • A cardholder is determined to hold a fraudulent identity.

1071 Similar to the situation in which the PIV Card is compromised, normal termination
1072 procedures must be in place. The PIV Card SHALL be revoked through the following
1073 procedure:

- 1074 • The PIV Card SHALL be collected and destroyed, if possible.
- 1075 • Per OPM guidance, the Central Verification System (or successor) SHALL be
1076 updated to reflect the change in status.
- 1077 • Any databases maintained by the PIV Card issuer that indicate current valid or
1078 invalid FASC-N or card UUID values SHALL be updated to reflect the change in
1079 status.
- 1080 • If the PIV Card cannot be collected and destroyed, the CA SHALL be informed and
1081 the certificates corresponding to the PIV authentication key and the asymmetric
1082 card authentication key on the PIV Card SHALL be revoked. The certificates
1083 corresponding to the digital signature and key management keys SHALL also be
1084 revoked, if present.

1085 In addition, the PIV Card termination procedures SHALL ensure all derived PIV
1086 credentials bound to the PIV account are invalidated as specified in Section 2.10.2.

1087 If the card cannot be collected, normal termination procedures SHALL be completed
1088 within 18 hours of notification. In certain cases, 18 hours is an unacceptable delay and in
1089 those cases emergency procedures SHOULD be executed to disseminate the information
1090 as rapidly as possible.

1091 The PII collected from the cardholder SHALL be disposed of in accordance with the
1092 stated privacy and data retention policies of the department or agency.

1093 **2.10 Derived PIV Credentials**

1094 Derived PIV credentials are additional PIV credentials that are issued based on proof
1095 of possession and control of a PIV Card. These credentials are not embedded in the
1096 PIV Card but instead are stand-alone or integrated in a variety of devices and platforms.
1097 Derived PIV credentials play an important role for environments where use of the PIV
1098 Card is not easily supported.

1099 **2.10.1 Derived PIV Credential Issuance Requirements**

1100 Issuance of a derived PIV credential is an instance of the post-enrollment binding of an
1101 authenticator described in [SP 800-63B] and SHALL be performed in accordance with
1102 the requirements that apply to physical authenticators as well as the requirements in this
1103 section.

1104 The binding and issuance of derived PIV credentials SHALL use valid PIV Cards to
1105 establish cardholder identity in accordance with [SP 800-157]. Derived PIV credentials
1106 MAY be created at the same Authenticator Assurance Level (AAL) as the PIV Card itself
1107 (i.e., AAL3) or MAY be created at AAL2, depending on the security characteristics of the
1108 authenticator. The issuer SHALL attempt to promptly notify the cardholder of the binding
1109 of a derived PIV credential through an independent means that would not afford an
1110 attacker an opportunity to erase the notification. More than one independent notification
1111 method MAY be used to ensure prompt receipt by the cardholder. Derived PIV
1112 credentials SHALL be bound to the cardholder's PIV account only by the organization
1113 that manages that PIV account.

1114 **2.10.2 Derived PIV Credential Invalidation Requirements**

1115 Derived PIV credentials SHALL be invalidated in any of the following circumstances:

- 1116 • Upon request of the PIV cardholder as a result of loss, failure, compromise, or
1117 intent to discontinue use of a derived PIV credential

- 1118 • At the determination of the issuer upon reported loss or suspected compromise of a
1119 derived PIV credential
- 1120 • At the determination of the issuer upon observation of possible fraudulent activity
- 1121 • When a cardholder is no longer eligible to have a PIV Card as specified in
1122 [Section 2.9.4](#); in this situation, all derived PIV credentials associated with the PIV
1123 account SHALL be invalidated.

1124 If the derived PIV credential to be invalidated contains a derived PIV authentication
1125 certificate and the corresponding private key cannot be securely zeroized or destroyed,
1126 the CA SHALL be informed and the certificate corresponding to the derived PIV
1127 authentication key SHALL be revoked.

1128 A derived PIV credential SHALL NOT be accepted for authentication once the credential
1129 has been invalidated. When invalidation occurs, the issuer SHALL notify the cardholder
1130 of the change.

1131 **2.11 PIV Privacy Requirements**

1132 [\[HSPD-12\]](#) explicitly states that “protect[ing] personal privacy” is a requirement of the
1133 PIV system. As such, all departments and agencies SHALL implement the PIV system
1134 in accordance with the spirit and letter of all privacy controls specified in this Standard,
1135 as well as those specified in federal privacy laws and policies including but not limited to
1136 the E-Government Act of 2002 [\[E-Gov\]](#), the Privacy Act of 1974 [\[PRIVACY\]](#), and OMB
1137 [\[M-03-22\]](#), as applicable.

1138 Departments and agencies may have a wide variety of uses for the PIV system and its
1139 components that were not intended or anticipated by the President in issuing [\[HSPD-12\]](#).
1140 In considering whether a proposed use of the PIV system is appropriate, departments and
1141 agencies SHALL consider the aforementioned control objectives and the purpose of this
1142 Standard, namely “to enhance security, increase Government efficiency, reduce identity
1143 fraud, and protect personal privacy” as per [\[HSPD-12\]](#). No department or agency SHALL
1144 implement a use of the identity credential inconsistent with these control objectives.

1145 To ensure privacy throughout the PIV lifecycle, departments and agencies SHALL do the
1146 following:

- 1147 • Assign an individual to the role of privacy official.¹³ The privacy official is
1148 the individual who oversees privacy-related matters in the PIV system and is
1149 responsible for implementing the privacy requirements in the Standard. The
1150 individual serving in this role SHALL NOT assume any other operational role
1151 in the PIV system.

¹³Privacy official refers to the Senior Agency Official for Privacy (SAOP) or Chief Privacy Officer (CPO).

- 1152 • Conduct a comprehensive Privacy Impact Assessment (PIA) on systems containing
1153 PII for the purpose of implementing PIV consistent with the methodology of
1154 [E-Gov] and the requirements of [M-03-22]. Consult with appropriate personnel
1155 responsible for privacy issues at the department or agency (e.g., Chief Information
1156 Officer) implementing the PIV system.
- 1157 • Write, publish, and maintain a clear and comprehensive document listing the types
1158 of information that will be collected (e.g., transactional information, PII), the
1159 purpose of collection, what information may be disclosed to whom during the life
1160 of the credential, how the information will be protected, and the complete set of
1161 uses of the credential and related information at the department or agency.
- 1162 • Provide PIV applicants with full disclosure of the intended uses of the information
1163 associated with the PIV Card and the related privacy implications.
- 1164 • Ensure that systems that contain PII for the purpose of enabling the implementation
1165 of PIV are handled in full compliance with fair information practices, as defined in
1166 [PRIVACY].
- 1167 • Maintain appeal procedures for those who are denied a credential or whose
1168 credentials are revoked.
- 1169 • Ensure that only personnel with a legitimate need for access to PII in the PIV
1170 system are authorized to access the PII, including but not limited to information
1171 and databases maintained for registration and credential issuance.¹⁴
- 1172 • Coordinate with appropriate department or agency officials to define consequences
1173 for violating privacy policies of the PIV system.
- 1174 • Ensure that the technologies used in the department or agency's implementation of
1175 the PIV system allow for continuous auditing of compliance with stated privacy
1176 policies and with practices governing the collection, use, and distribution of
1177 information in the operation of the program.
- 1178 • Utilize security controls described in [SP 800-53] to accomplish privacy goals,
1179 where applicable.
- 1180 • Ensure that the technologies used to implement PIV sustain and do not erode
1181 privacy protections relating to the use, collection, and disclosure of PII. Agencies
1182 MAY choose to deploy PIV Cards with electromagnetically opaque holders or other
1183 technology to protect against any unauthorized contactless access to information
1184 stored on a PIV Card.

¹⁴Agencies may refer to [SP 800-122] for best practice guidelines on protection of PII.

3. PIV System Overview

This section is informative. It serves to provide an overview of the different components of the PIV system.

The PIV system is composed of components and processes that support a common platform for identity authentication across federal departments and agencies for access to multiple types of physical and logical access environments. The specifications for the PIV components in this Standard promote uniformity and interoperability among the various PIV system components, across departments and agencies, and across installations. The specifications for processes in this Standard are a set of minimum requirements for the various activities that need to be performed within an operational PIV system. When implemented in accordance with this Standard, PIV Cards and derived PIV credentials support a suite of authentication mechanisms that can be used consistently across departments and agencies. The authenticated identity information can then be used as a basis for access control in physical and logical access environments. The following sections briefly discuss the functional components of the PIV system and the lifecycle activities of the PIV Card.

3.1 Functional Components

An operational PIV system can be divided into three major subsystems:

PIV Front-End Subsystem

The PIV Card, card readers, biometric capture devices, and PIN input devices, as well as any derived PIV credentials used by the PIV cardholder. The PIV cardholder interacts with these components to gain physical or logical access to the desired federal resource.

PIV Issuance and Management Subsystem

The components responsible for identity proofing and registration, card and key issuance and management, and the various repositories and services required as part of the verification infrastructure, such as Public Key Infrastructure (PKI) directories and certificate status servers. This subsystem also manages the binding and termination of derived PIV credentials as described in [Section 2.10](#).

PIV Relying Subsystem

The physical and logical access control systems, protected resources, and authorization data.

[Figure 3-1](#) illustrates a notional model for the operational PIV system, identifying the various system components. The boundary shown in the figure is not meant to preclude FIPS 201 requirements on systems outside of these boundaries. See [Section 3.3](#) for information about data flow and connections between components.

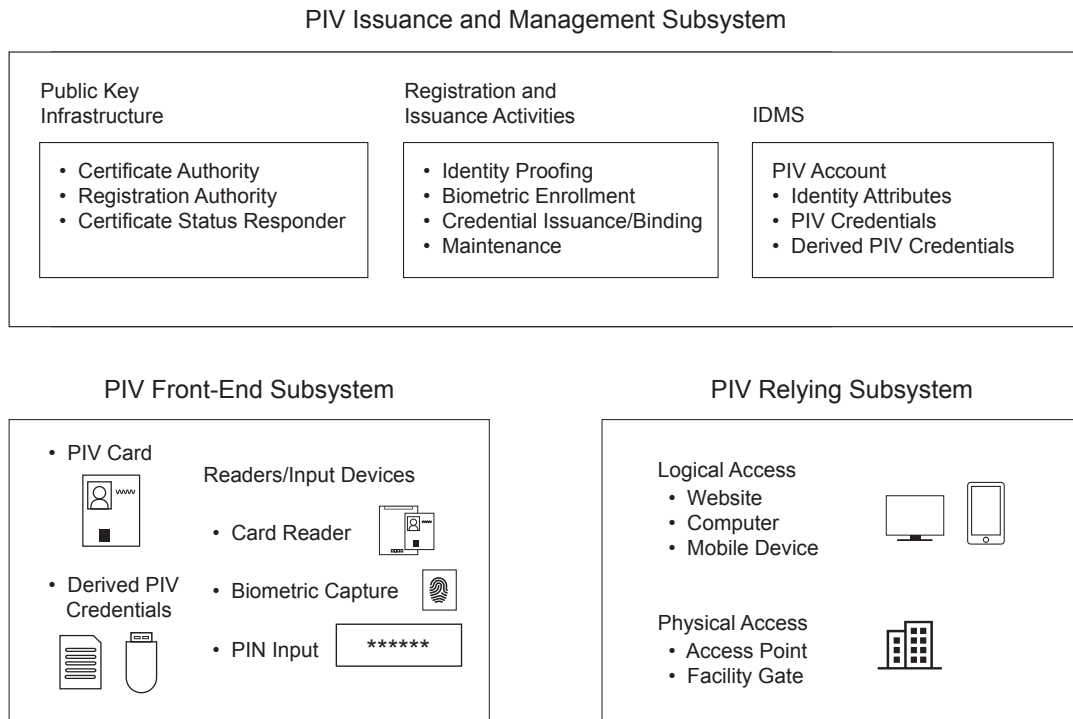

Figure 3-1. PIV System Overview

1221 **3.1.1 PIV Front-End Subsystem**

1222 The PIV Front-End Subsystem in [Figure 3-1](#) consists of credentials and devices that
 1223 are used during authentication. The PIV Card will be issued to the applicant when all
 1224 identity proofing, registration, and issuance processes have been completed. Derived PIV
 1225 credentials might also be registered after these processes are complete. The PIV Card
 1226 takes the physical form of the [\[ISO 7816\]](#) ID-1 card type (i.e., traditional payment card)
 1227 with one or more embedded Integrated Circuit Chips (ICC) that provide memory capacity
 1228 and computational capability. The PIV Card is the primary component of the PIV system.
 1229 The cardholder uses the PIV Card for authentication to access various physical and logical
 1230 resources. Alternatively, derived PIV credentials increasingly play an important role as
 1231 additional authenticators, especially in environments where use of the PIV Card is not
 1232 easily supported. These AAL2 and AAL3 authenticators are not embedded in the PIV
 1233 Card but, rather, are stand-alone or integrated in a variety of devices and platforms.

1234 Card readers are located at access points for controlled resources to allow a cardholder
 1235 to gain physical or logical access using the PIV Card. The reader communicates with a
 1236 PIV Card to perform the authentication protocol and relay that information to the access
 1237 control systems for granting or denying access.

1238 Card writers, which are similar to card readers, personalize and initialize the information
1239 stored on PIV Cards. Card writers may also be used to perform remote PIV Card updates
1240 (see [Section 2.9.2](#)). The data to be stored on PIV Cards includes cardholder information,
1241 certificates, cryptographic keys, the PIN, and biometric data.

1242 PIN input devices can be used along with card readers when a higher level of
1243 authentication assurance is required. The cardholder presenting the PIV Card types
1244 their PIN into the PIN input device. For physical access, the PIN is typically entered
1245 using a PIN pad device; a keyboard is generally used for logical access. The input of a
1246 PIN provides a “something you know”¹⁵ authentication factor that activates¹⁶ the PIV
1247 Card and enables access to other credentials resident on the card that provide additional
1248 factors of authentication. A cryptographic key and certificate, for example, provide an
1249 additional authentication factor of “something you have” (i.e., the card) through PKI-
1250 based authentication.

1251 Biometric capture devices may be located at secure locations where a cardholder may
1252 want to gain access. These devices depend upon the use of the biometric data of the
1253 cardholder, stored in the memory of the card, and its comparison with a real-time
1254 captured biometric sample. The use of biometric characteristics provides an additional
1255 factor of authentication (“something you are”).

1256 **3.1.2 PIV Issuance and Management Subsystem**

1257 The registration and issuance activities in [Figure 3-1](#) start with identity proofing and
1258 registration, during which all information and documentation required for enrollment
1259 are collected, stored, and maintained. The collected information is subsequently used to
1260 personalize and issue the PIV Card, as well as to bind and issue derived PIV credentials
1261 as additional PIV authenticators.

1262 The PIV Card issuance process focuses on the personalization of the physical (visual
1263 surface) and logical (contents of the ICC) aspects of the card at the time of issuance and
1264 maintenance thereafter. This includes printing photographs, names, and other information
1265 on the card and loading the relevant card applications, biometric data, and other data.

1266 The PKI component provides services for PKI-based PIV credentials. This component
1267 is used throughout the lifecycle of PIV Cards and PKI-based derived PIV credentials—
1268 from generation and loading of authentication keys and PKI credentials, to usage of
1269 these keys for secure operations, to eventual reissuance or termination of the PIV Card
1270 and associated PKI-based derived PIV credentials. At the personalization phase, the
1271 PKI component issues and distributes the digital certificates for the keys generated on-
1272 card and keys generated for PKI-based derived PIV credentials. During use of the PIV

¹⁵For more information on the terms “something you know,” “something you have,” and “something you are,” see [\[SP 800-63\]](#).

¹⁶Alternatively, a biometric on-card one-to-one comparison can be used to activate the PIV Card.

1273 credentials at authentication, the PKI component provides the requesting application with
1274 the certificate status information of the PKI credentials requesting access.

1275 The enterprise IDMS serves as the central repository for the cardholder's digital identities.
1276 It is where the relevant cardholder attributes are maintained. The IDMS creates the PIV
1277 account and associates the cardholder's PIV Card and derived PIV credentials with the
1278 account. The account is maintained throughout the cardholder's employment with the
1279 organization. Various Identity, Credential, and Access Management (ICAM)-related
1280 systems connect to the IDMS to request or update cardholder attributes. For example

- 1281 • A security office may provide updated background investigative information to the
1282 IDMS.
- 1283 • An HR system may relay hiring status updates.
- 1284 • The IDMS may serve as the Identity Provider (IdP), authenticating the cardholder
1285 on behalf of a Relying Party (RP) and issuing assertions of attributes relating to the
1286 PIV account to the RP.

1287 **3.1.3 PIV Relying Subsystem**

1288 The PIV relying subsystem in [Figure 3-1](#) includes components responsible for
1289 determining a particular PIV cardholder's access to a physical or logical resource.¹⁷ A
1290 physical resource is the secured facility (e.g., building, room, parking garage) that the
1291 cardholder wishes to access. The logical resource is typically a network or a location on
1292 the network (e.g., computer workstation, folder, file, database record, software program)
1293 to which the cardholder wants to gain access.

1294 The relying subsystem depends on authorization mechanisms that define the privileges
1295 (authorizations) possessed by entities requesting to access a particular logical or physical
1296 resource. An example of this is an Access Control List (ACL) associated with a file on a
1297 computer system.

1298 The PIV relying subsystem becomes relevant when the PIV Card or derived PIV
1299 credential is used to authenticate a cardholder who is seeking access to a physical or
1300 logical resource. Although this Standard does not provide technical specifications for this
1301 subsystem, various mechanisms for authentication are defined in [Section 6](#) for PIV Cards
1302 and in [\[SP 800-157\]](#) for derived PIV credentials to provide consistent and secure means
1303 for performing the authentication function preceding an access control decision.

1304 The relying subsystem identifies and authenticates cardholders either by interacting with
1305 the PIV Card using mechanisms discussed in [Section 6](#) or by communicating with an IdP
1306 through a federation protocol as discussed in [Section 7](#). Once authenticated, authorization
1307 mechanisms that support the relying subsystem grant or deny access to resources based on
1308 the privileges assigned to the cardholder.

¹⁷The cardholder may authenticate with the PIV Card or a derived PIV credential.

1309 **3.2 PIV Card Lifecycle Activities**

1310 The PIV Card lifecycle consists of seven activities.¹⁸ The activities that take place during
1311 fabrication and pre-personalization of the card at the manufacturer are not considered a
1312 part of this lifecycle model. [Figure 3-2](#) presents these PIV activities and depicts the PIV
1313 Card request as the initial activity and PIV Card termination as the end of life activity.

1314 The seven card lifecycle activities are as follows:

1315 **PIV Card Request**

1316 The initiation of a request for the issuance of a PIV Card to an applicant and the
1317 validation of this request.

1318 **Identity Proofing and Registration**

1319 Verification of the claimed identity of the applicant, including verification that the
1320 entire set of identity source documents presented at the time of registration is valid,
1321 capture of biometric characteristics, and creation of the PIV enrollment record.¹⁹

1322 **PIV Card Issuance**

1323 Personalization (physical and logical) and issuance of the card to the intended
1324 applicant.

1325 **PKI Credential Issuance**

1326 Generation of logical credentials and loading them onto the PIV Card.

1327 **PIV Card Usage**

1328 Use of the PIV Card to perform cardholder authentication for access to a physical or
1329 logical resource. Access authorization decisions are made after successful cardholder
1330 identification and authentication.

1331 **PIV Card Maintenance**

1332 Maintenance or update of the physical PIV Card and its data. Such data includes
1333 various card applications, PINs, PKI credentials, and biometric data.

1334 **PIV Card Termination**

1335 Permanent destruction or invalidation of the PIV Card and the data and keys needed
1336 for authentication so as to prevent any future use of the PIV Card for authentication.

¹⁸The lifecycle activities of derived PIV credentials are described in SP 800-157.

¹⁹In some other National Institute of Standards and Technology (NIST) documents such as [\[SP 800-63A\]](#), registration is referred to as *enrollment*.

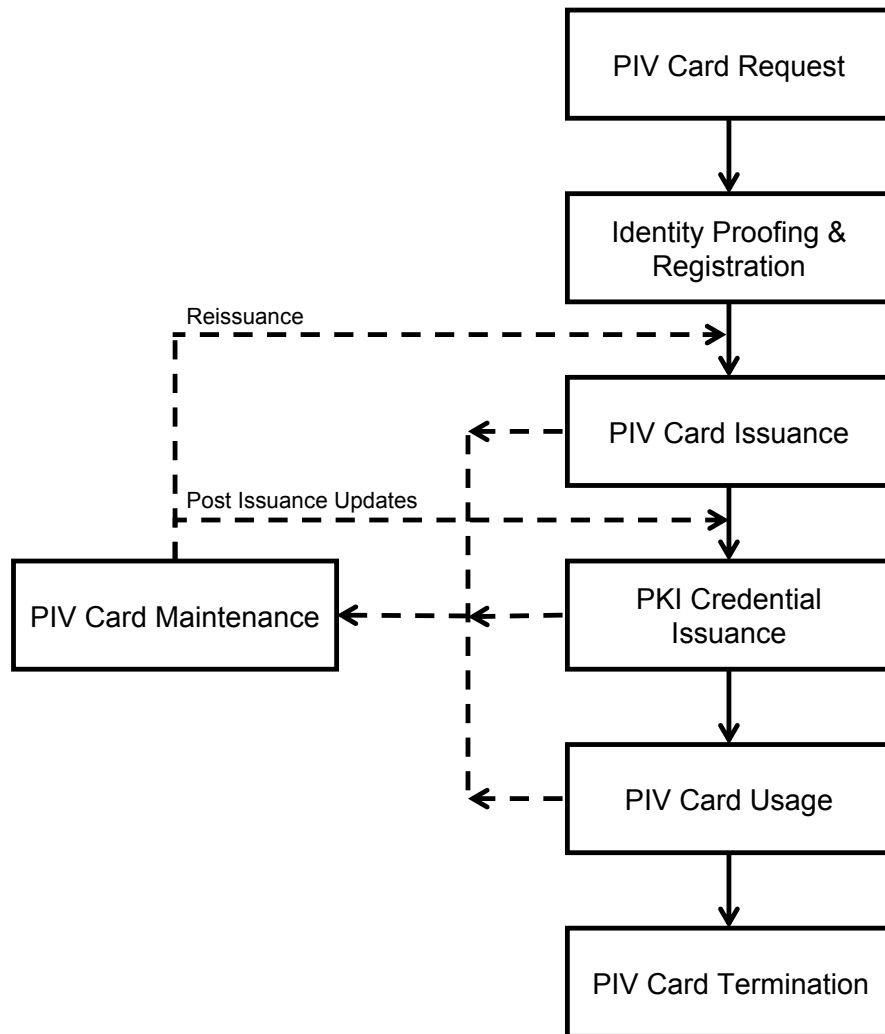

Figure 3-2. PIV Card Lifecycle Activities

1337 **3.3 Connections Between System Components**

1338 To perform authentication for logical or physical access using a PIV Card or a derived
1339 PIV credential directly, the credential is verified and attributes from the PIV account
1340 are provided to the relying subsystem. The connections and data flows between these
1341 components are shown in [Figure 3-3](#).

1342 While it is possible to directly accept a PIV Card issued by another agency, the
1343 recommended interoperability mechanism for most agencies is to use a federation
1344 protocol, as discussed in [Section 7](#). In this method, the PIV cardholder authenticates
1345 to an IdP, which is part of the PIV Issuance and Management Subsystem, using their
1346 PIV Card or derived PIV credential. The IdP verifies the credential and determines the
1347 attributes associated with the PIV account. The IdP then creates an assertion that is sent
1348 to the relying subsystem. The RP validates the assertion from the IdP, but the RP never
1349 sees the credential or authentication at the IdP. The connections and data flows between
1350 these components are shown in [Figure 3-4](#).

1351 While this Standard makes no requirements on when to apply direct or federated
1352 authentication mechanisms, there are some natural mappings. For example, physical
1353 access systems are not usually well-suited for a federation protocol. Also, many derived
1354 PIV credentials can only be verified by their issuer and are therefore better suited for use
1355 as part of a federation protocol.

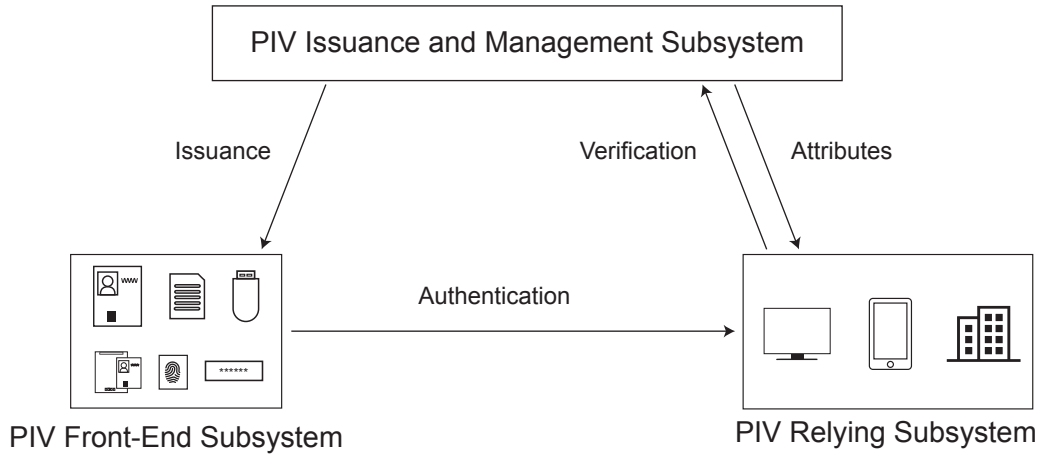

Figure 3-3. PIV System Connections

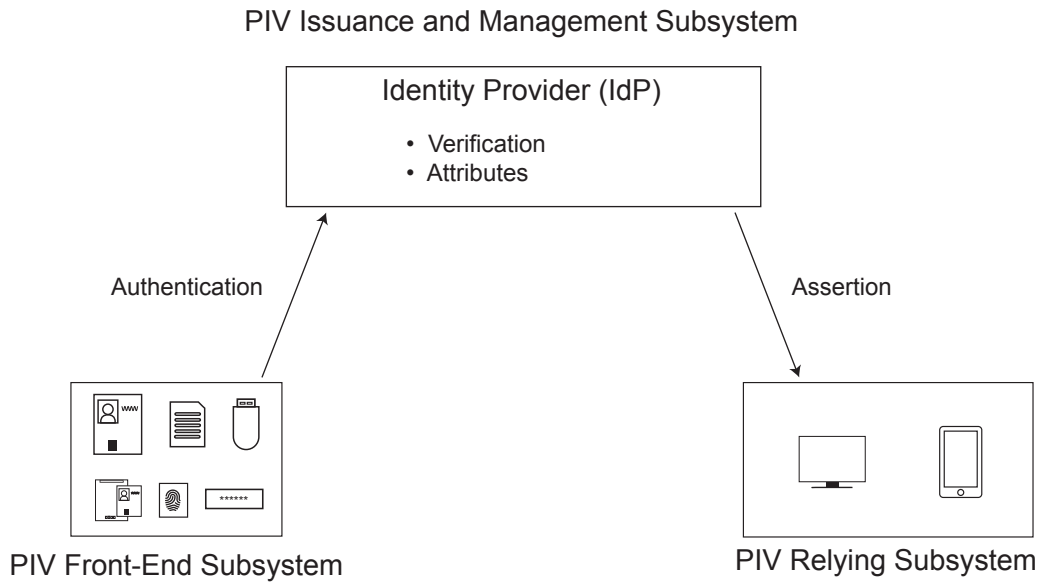

Figure 3-4. PIV System Federation Connections

1356 **4. PIV Front-End Subsystem**

1357 *This section is normative.* It provides the requirements for the PIV front-end subsystem
1358 components.

1359 **4.1 PIV Card Physical Characteristics**

1360 References to the PIV Card in this section pertain to its physical characteristics only.
1361 References to the front of the card apply to the side of the card that contains electronic
1362 contacts. References to the back of the card apply to the side opposite the front.

1363 The PIV Card's physical appearance and other characteristics should balance the need to
1364 have the PIV Card commonly recognized as a federal identification card while providing
1365 the flexibility to support individual department and agency requirements. Having a
1366 common look for PIV Cards is important in meeting the objectives of improved security
1367 and interoperability. In support of these objectives, consistent placement of printed
1368 components and technology is necessary.

1369 The PIV Card SHALL comply with the physical characteristics described in [ISO 7810],
1370 [ISO 10373], and [ISO 7816] for contact cards in addition to [ISO 14443] for contactless
1371 cards.

1372 **4.1.1 Printed Material**

1373 The printed material SHALL NOT rub off during the life of the PIV Card. The printing
1374 process SHALL NOT deposit debris on the printer rollers during printing and laminating.
1375 Printed material SHALL NOT interfere with the ICCs or related components, nor SHALL
1376 it obstruct access to machine-readable information.

1377 **4.1.2 Tamper-proofing and Resistance**

1378 To combat counterfeiting and alterations, the PIV Card SHALL contain security features
1379 outlined in the American Association of Motor Vehicle Association's (AAMVA) Drivers
1380 License/Identification Card (DL/ID) Card Design Standard [CDS]. The Card Design
1381 Standard classifies security features into three categories, depending on the inspection
1382 level required for verification:

1383 **Inspection Level 1**

1384 Security features that can be examined without tools or aids and include easily
1385 identifiable visual or tactile features for rapid inspection at point of usage. Examples
1386 include an embossed surface pattern, an optically variable device (such as a
1387 hologram), or color-shifting inks.

1388 **Inspection Level 2**

1389 Security features that require the use of a tool or instrument (e.g., UV light,
1390 magnifying glass, or scanner) to discern. Examples include microtext, UV-fluorescent
1391 images, IR-fluorescent ink, nano and micro images, and chemical taggants.

1392 **Inspection Level 3**

1393 Security features inspected by forensic specialists to conduct in-depth examination
1394 that may require special equipment to provide true certification.

1395 A PIV Card SHALL incorporate at least one security feature at inspection level 1 or
1396 inspection level 2. Federal departments and agencies SHOULD incorporate additional
1397 security features and include all three inspection levels.

1398 Incorporation of security features SHALL

- 1399 • be in accordance with durability requirements;
- 1400 • be free of defects, such as fading and discoloration;
- 1401 • not obscure printed information; and
- 1402 • not impede access to machine-readable information.

1403 All security features SHOULD maintain their function for the life of the card. As a
1404 generally accepted security procedure, federal departments and agencies SHOULD
1405 periodically review the viability, effectiveness, and currency of employed tamper
1406 resistance and anti-counterfeiting methods.

1407 **4.1.3 Physical Characteristics and Durability**

1408 This section describes the physical requirements for the PIV Card.

1409 The PIV Card SHALL contain a contact and a contactless ICC interface.

1410 The card body SHALL be white in accordance with color representation in [Section 4.1.5](#).
1411 Only security features, as described in [Section 4.1.2](#), may modify the perceived color
1412 slightly. Presence of security features SHALL NOT prevent the recognition of white as
1413 the principal card body color by a person with normal vision (corrected or uncorrected) at
1414 a working distance of 50 cm to 200 cm.

1415 The card body structure SHALL consist of card materials that satisfy the card
1416 characteristics in [\[ISO 7810\]](#) and test methods in [\[ANSI 322\]](#). Although the [\[ANSI 322\]](#)
1417 test methods do not currently specify compliance requirements, the tests SHALL be used
1418 to evaluate card material durability and performance. These tests SHALL include card
1419 flexure, static stress, plasticizer exposure, impact resistance, card structural integrity,
1420 surface abrasion, temperature and humidity-induced dye migration, ultraviolet light
1421 exposure, and laundry test. Cards SHALL NOT malfunction or delaminate after hand
1422 cleaning with a mild soap and water mixture.

1423 The card SHALL be subjected to sunlight exposure in accordance with Section 5.12 of
1424 [ISO 10373] or to ultraviolet and daylight fading exposure in accordance with [ANSI 322].
1425 Sunlight exposure in accordance with [ISO 10373] SHALL be in the form of actual,
1426 concentrated, or artificial sunlight that appropriately reflect 2 000 hours of southwestern
1427 United States' sunlight. Concentrated sunlight exposure SHALL be performed in
1428 accordance with [G90-17] and accelerated exposure in accordance with [G155-2013].
1429 The card SHALL be subjected to the [ISO 10373] dynamic bending test and SHALL have
1430 no visible cracks or failures after the [ISO 10373] or [ANSI 322] exposure.

1431 There are methods by which proper card orientation can be indicated. Section 4.1.4.3, for
1432 example, defines Zones 21F and 22F, where card orientation features MAY be applied.²⁰
1433 Note: If an agency determines that tactilely discernible markers for PIV Cards impose an
1434 undue burden, the agency SHALL implement policies and procedures to accommodate
1435 employees and contractors with disabilities in accordance with Sections 501 and 504 of
1436 the Rehabilitation Act.

1437 The card SHALL be 27 mil to 33 mil (0.68 mm to 0.84 mm) thick before lamination, in
1438 accordance with [ISO 7810].

1439 The PIV Card SHALL NOT be embossed other than for security and accessibility
1440 features.

1441 Decals SHALL NOT be adhered to the card.

1442 Departments and agencies MAY choose to punch an opening in the card body to
1443 enable the card to be oriented by touch or to be worn on a lanyard. Departments and
1444 agencies should ensure such alterations are closely coordinated with the card vendor and
1445 manufacturer to ensure the card material integrity and printing process are not adversely
1446 impacted. Departments and agencies SHOULD ensure such alterations do not

- 1447 • compromise card body durability requirements and characteristics;
- 1448 • invalidate card manufacturer warranties or other product claims;
- 1449 • alter or interfere with printed information, including the photograph; or
- 1450 • damage or interfere with machine-readable technology, such as the embedded
1451 antenna.

1452 The card material SHALL withstand the effects of temperatures required by the
1453 application of a polyester laminate on one or both sides of the card by commercial off-
1454 the-shelf (COTS) equipment. The thickness added due to a laminate layer SHALL
1455 NOT interfere with the smart card reader operation. The card material SHALL allow
1456 production of a flat card in accordance with [ISO 7810] after lamination of one or both
1457 sides of the card.

1458 The PIV Card MAY be subjected to additional testing.

²⁰For some individuals, the contact surface for the ICC may be sufficient for determining the orientation of the card.

1459 **4.1.4 Visual Card Topography**

1460 The information on a PIV Card SHALL be in visual printed and electronic form. This
1461 section covers the placement of visual and printed information. It does not cover
1462 information stored in electronic form, such as stored data elements or other possible
1463 machine-readable technologies. Logically stored data elements are discussed in
1464 [Section 4.2](#).

1465 As noted in [Section 4.1.3](#), the PIV Card SHALL contain a contact and a contactless
1466 ICC interface. This Standard does not specify the number of chips used to support the
1467 mandated contact and contactless interfaces.

1468 To achieve a common PIV Card appearance and provide departments and agencies with
1469 the flexibility to augment the card with department- or agency-specific requirements, the
1470 card SHALL contain printed information and machine-readable technologies. Mandated
1471 and optional items SHALL be placed as described and depicted. Printed data SHALL
1472 NOT interfere with machine-readable technology.

1473 Areas that are marked as reserved SHOULD NOT be used for printing. The reason for
1474 the recommended reserved areas is that placement of the embedded contactless ICC
1475 module may vary between manufacturers, and there are constraints that prohibit printing
1476 over the embedded contactless module. The PIV Card topography provides flexibility
1477 for placement of the embedded module, either in the upper right corner or in the lower
1478 portion. Printing restrictions apply only to the area where the embedded module is
1479 located.

1480 Unless otherwise specified, all data labels SHALL be printed in 5 pt Arial with the
1481 corresponding data in 6 pt Arial Bold. Unless otherwise specified, all text SHALL be
1482 printed in black.

1483 **4.1.4.1 Mandatory Items on the Front of the PIV Card**

1484 **Zone 1F: Photograph**

1485 The photograph SHALL be placed in the upper left corner, as depicted in [Figure 4-1](#),
1486 and be a frontal pose from top of the head to shoulder. A minimum of 300 dots
1487 per inch (DPI) resolution SHALL be used. The background SHALL follow
1488 recommendations set forth in [\[SP 800-76\]](#).

1489 **Zone 2F: Name**

1490 The full name²¹ SHALL be printed directly under the photograph in capital letters
1491 from the American Standard Code for Information Interchange (ASCII) character set
1492 specified in [\[RFC 20\]](#). The full name SHALL be composed of a primary identifier

²¹Alternatively, an authorized pseudonym as provided under the law as discussed in [Section 2.8.1](#).

1493 (i.e., surnames or family names) and a secondary identifier (i.e., pre-names or
1494 given names). The printed name SHALL match the name on the identity source
1495 documents provided during identity proofing and registration to the extent possible.
1496 The full name SHALL be printed in the PRIMARY IDENTIFIER, SECONDARY
1497 IDENTIFIER format. The entire full name SHOULD be printed on available lines of
1498 Zone 2F and either identifier MAY be wrapped. The wrapped identifier SHALL be
1499 indicated with the “>” character at the end of the line. The identifiers MAY be printed
1500 on separate lines if each fits on one line. Departments and agencies SHALL use the
1501 largest font in the range of 7 pt to 10 pt Arial Bold that allows the full name to be
1502 printed. Using 7 pt Arial Bold allows space for three lines and SHALL only be used if
1503 the full name does not fit on two lines in 8 pt Arial Bold. Table 4-1 provides examples
1504 of separate primary and secondary identifier lines, single line with identifiers,
1505 wrapped full names, and full name in three lines. Note that the truncation SHOULD
1506 only occur if the full name cannot be printed in 7 pt Arial Bold.

1507 Names in the primary identifier and the first name in the secondary identifier SHALL
1508 NOT be abbreviated. Other names and conventional prefixes and suffixes, which
1509 SHALL be included in the secondary identifier, MAY be abbreviated. The special
1510 character “.” (period) SHALL indicate such abbreviations, as shown in Figure 4-2.
1511 Other uses of special symbols (e.g., the apostrophe in “O’BRIEN”) are at the
1512 discretion of the issuer.

1513 **Zone 7F: Contact Area**

1514 The electronic contact interface for the card as defined by [ISO 7816]. Printed items
1515 SHALL NOT cover the contact surface. The total size of the contact surface can vary
1516 between manufacturers. The area shown in Figure 4-1 roughly represents the minimal
1517 possible size.

1518 **Zone 8F: Employee Affiliation**

1519 An employee affiliation SHALL be printed on the card as depicted in Figure 4-1.
1520 Examples of employee affiliation include “Employee,” “Contractor,” “Active Duty,”
1521 and “Civilian.”

1522 **Zone 10F: Agency, Department, or Organization**

1523 The organizational affiliation SHALL be printed as depicted in Figure 4-1.

1524 **Zone 14F: Card Expiration Date**

1525 The card expiration date SHALL be printed on the card as depicted in Figure 4-1. The
1526 card expiration date SHALL be in a YYYYMMDD format. The YYYY characters
1527 represent the four-digit year; the DD characters represent the two-digit day of the
1528 month; and the MMM characters represent the three-letter month abbreviation as
1529 follows: JAN, FEB, MAR, APR, MAY, JUN, JUL, AUG, SEP, OCT, NOV, and DEC.
1530 The Zone 14F expiration date SHALL be printed in 6 pt to 9 pt Arial Bold.

Table 4-1. Name Examples

Name	Characteristics	Example
John Doe	Simple full name of individual who does not have a middle name, two lines sufficient at 10 pt.	
Anna Maria Eriksson	Simple full name, two lines sufficient at 10 pt.	
Anna Maria Eriksson	Simple full name with abbreviated middle name, two lines sufficient at 10 pt.	
Anna Maria Eriksson	Simple full name, one line sufficient for full name at 10 pt.	
Susie Margaret Smith-Jones	Longer full name in two lines, sufficient space at 10 pt.	
Susie Margaret Smith-Jones	Longer full name wrapped, two lines sufficient at 10 pt.	
Chayapa Dejthamrong Krusuang Nilavadhanananda	Longer full name wrapped, two lines not sufficient at 10 pt. Reduce to 8 pt.	
Vaasa Silvaan Beenelong Wooloomooloo Warrandyte Warwarnambool	Longer full name, two lines not sufficient at 8 pt, 7 pt allows sufficient space for three lines in Zone 2F.	
Vaasa Silvaan Beenelong Wooloomooloo Warrandyte Warwarnambool	Same as previous but full name is wrapped.	
Dingo Pontooroomooloo Vaasa Silvaan Beenelong Wooloomooloo Warrandyte Warwarnambool	Truncated full name, three lines at 7 pt not sufficient.	

Zone 15F: Color-Coding for Employee Affiliation

Color-coding SHALL be used for additional identification of employee affiliation as a background color for Zone 2F (name) as depicted in [Figure 4-1](#), [Figure 4-3](#), and [Figure 4-4](#). The following color scheme SHALL be used:

- blue: foreign national,
- white: government employee, or
- green: contractor.

Foreign national color-coding has precedence over government employee and contractor color-coding. These colors SHALL be reserved and SHALL NOT be employed for other purposes. These colors SHALL be printed in accordance with the color specifications provided in [Section 4.1.5](#). Zone 15F MAY be a solid or patterned line at the department or agency's discretion.

Zone 18F: Color Code for Employee Affiliation

The affiliation color codes "B" for blue, "W" for white, and "G" for green SHALL be printed in a white circle on the right side of Zone 15F, as depicted in [Figure 4-1](#). The diameter of the circle SHALL NOT be more than 5 mm. The lettering SHALL correspond to the printed color in Zone 15F.

Zone 19F: Card Expiration Date

The card expiration date SHALL be printed in a MMMYYYY format in the upper right-hand corner as depicted in [Figure 4-1](#). The YYYY characters represent the four-digit year and the MMM characters represent the three-letter month abbreviation as follows: JAN, FEB, MAR, APR, MAY, JUN, JUL, AUG, SEP, OCT, NOV, and DEC. The Zone 19F expiration date SHALL be printed in 12 pt Arial Bold.

4.1.4.2 Mandatory Items on the Back of the PIV Card**Zone 1B: Agency Card Serial Number**

This item SHALL be printed on the back of the card and contain the unique serial number from the issuing department or agency. The format SHALL be at the discretion of the issuing department or agency. The preferred placement is as depicted in [Figure 4-6](#), but variable placement along the outer edge is allowed in accordance with other FIPS 201 requirements, as shown in [Figure 4-8](#).

Zone 2B: Issuer Identification Number

This item SHALL be printed as depicted in [Figure 4-6](#) and consist of six characters for the department code, four characters for the agency code, and a five-digit number that uniquely identifies the issuing facility within the department or agency.

1565 4.1.4.3 Optional Items on the Front of the PIV Card

1566 This section contains a description of the optional information and machine-readable
1567 technologies that may be used as well as their respective placement. The storage capacity
1568 of all optional technologies is as prescribed by individual departments and agencies and is
1569 not addressed in this Standard. Although the items discussed in this section are optional,
1570 if used, they SHALL be placed on the card as designated in the examples provided and as
1571 noted.

1572 **Zone 3F: Signature**

1573 If used, the department or agency SHALL place the cardholder signature below
1574 the photograph and cardholder name, as depicted in [Figure 4-3](#). The space for
1575 the signature SHALL NOT interfere with the placement of the ICCs and related
1576 components. Because of card surface space constraints, placement of a signature
1577 may limit the size of the optional two-dimensional bar code.

1578 **Zone 4F: Agency-Specific Text Area**

1579 If used, this area can be used for printing agency-specific requirements, such as
1580 employee status, as shown in [Figure 4-2](#). Note that this zone overlaps with an area
1581 that some card manufacturers might not allow to be used for printing.

1582 **Zone 5F: Rank**

1583 If used, the cardholder's rank SHALL be printed in the area, as illustrated in
1584 [Figure 4-2](#). Data format is at the department or agency's discretion.

1585 **Zone 6F: Portable Data File (PDF) 417 Two-Dimensional Bar Code (Deprecated)**

1586 This bar code is deprecated in this version of the Standard. In a future version of this
1587 Standard, the bar code may be removed. If used, the PDF bar code SHALL be placed
1588 in the general area depicted in [Figure 4-4](#) (i.e., left side of the card). If Zone 3F (a
1589 cardholder signature) is used, the size of the PDF bar code may be affected. The card
1590 issuer SHALL confirm that a PDF used in conjunction with a PIV Card containing a
1591 cardholder signature will satisfy the anticipated PDF data storage requirements. Note
1592 that this zone overlaps with an area that some card manufacturers might not allow to
1593 be used for printing.

1594 **Zone 9F: Header**

1595 If used, the text "United States Government" SHALL be placed as depicted in
1596 [Figure 4-3](#), [Figure 4-4](#), and [Figure 4-5](#). Departments and agencies MAY instead use
1597 this zone for other department or agency-specific information, such as identifying
1598 a federal emergency responder role, as depicted in [Figure 4-2](#). Some examples of
1599 official roles are "Law Enforcement," "Fire Fighter," and "Emergency Response Team
1600 (ERT)."

Zone 11F: Agency Seal

1601
1602 If used, the seal selected by the issuing department, agency, or organization SHALL
1603 be printed in the area depicted. It SHALL be printed using the guidelines provided in
1604 [Figure 4-2](#) to ensure that information printed on the seal is legible and clearly visible.

Zone 12F: Footer

1605
1606 If used as the federal emergency response official identification label, a department
1607 or agency SHALL print “Federal Emergency Response Official” as depicted in
1608 [Figure 4-2](#). The label SHOULD be in white lettering on a red background. Additional
1609 information regarding the federal emergency responder role MAY be included in Zone
1610 9F, as depicted in [Figure 4-2](#).

1611 When Zone 15F indicates foreign national affiliation and the department or agency
1612 does not need to highlight emergency response official status, Zone 12F MAY be
1613 used to denote the country or countries of citizenship. If so used, the department or
1614 agency SHALL print the country name or the three-letter country abbreviation (alpha-
1615 3 format) in accordance with [\[ISO 3166\]](#). [Figure 4-4](#) illustrates an example of using
1616 country abbreviations for a card issued to a foreign national.

1617 Note that this zone overlaps with an area that some card manufacturers might not
1618 allow to be used for printing.

Zone 13F: Issue Date

1619
1620 If used, the card issuance date SHALL be printed above the Zone 14F expiration
1621 date in YYYYMMDD format, as depicted in [Figure 4-3](#). The YYYY characters
1622 represent the four-digit year; the DD characters represent the two-digit day of the
1623 month; and the MMM characters represent the three-letter month abbreviation as
1624 follows: JAN, FEB, MAR, APR, MAY, JUN, JUL, AUG, SEP, OCT, NOV, and DEC.

Zone 16F: Photograph Border

1625
1626 A border MAY be used with the photograph to further identify employee affiliation,
1627 as depicted in [Figure 4-3](#). This border MAY be used in conjunction with Zone 15F
1628 to enable departments and agencies to develop various employee categories. The
1629 photograph border SHALL NOT obscure the photograph. The border MAY be a solid
1630 or patterned line. For solid and patterned lines, red SHALL be reserved for emergency
1631 response officials, blue for foreign nationals, and green for contractors. All other
1632 colors MAY be used at the department or agency’s discretion.

Zone 17F: Agency-Specific Data

1633
1634 In cases where other defined optional elements are not used, Zone 17F MAY be used
1635 for other department or agency-specific information, as depicted in [Figure 4-5](#).

Zone 20F: Organizational Affiliation Abbreviation

The organizational affiliation abbreviation MAY be printed in the upper right-hand corner below the Zone 19F expiration date as shown in [Figure 4-2](#). If printed, the organizational affiliation abbreviation SHALL be printed in 12 pt Arial Bold.

Zone 21F: Edge Ridging or Notched Corner Tactile Marker

If used, this area SHALL incorporate edge ridging or a notched corner to indicate card orientation, as depicted in [Figure 4-4](#). Departments and agencies SHOULD closely coordinate such alterations with the card vendor and manufacturer to ensure that the card material integrity and printing process are not adversely impacted.

Zone 22F: Laser Engraving Tactile Marker

If used, tactilely discernible marks SHALL be created using laser engraving to indicate card orientation, as depicted in [Figure 4-4](#). There SHALL be an opening in the lamination foil where laser engraving is performed. Departments and agencies SHOULD closely coordinate such alterations with the card vendor and manufacturer to ensure that the card material integrity and printing process are not adversely impacted.

4.1.4.4 Optional Items on the Back of the PIV Card**Zone 3B: Magnetic Stripe (Deprecated)**

The magnetic stripe is deprecated in this version of the Standard. In a future version of this Standard, the magnetic stripe may be removed and the space may be allocated for agency-specific data to be printed. If used, the magnetic stripe SHALL be high coercivity and placed in accordance with [ISO 7811], as illustrated in [Figure 4-8](#).

Zone 4B: Return Address

If used, the “return if lost” language SHALL be placed on the back of the card in the general area depicted in [Figure 4-7](#).

Zone 5B: Physical Characteristics of Cardholder

If used, the cardholder physical characteristics (e.g., height, eye color, hair color) SHALL be printed in the general area illustrated in [Figure 4-7](#).

Zone 6B: Additional Language for Emergency Response Officials

Departments and agencies MAY choose to provide additional information to identify emergency response officials or to better identify the cardholder’s authorized access. If used, this additional text SHALL be in the general area depicted in [Figure 4-7](#) and SHALL NOT interfere with other printed text or machine-readable components. An example of a printed statement is provided in [Figure 4-7](#).

Zone 7B: Section 499, Title 18 Language

1670
1671 If used, standard Section 499, Title 18, language warning against counterfeiting,
1672 altering, or misusing the card SHALL be printed in the general area depicted in
1673 [Figure 4-7](#).

Zone 8B: Linear 3 of 9 Bar Code (Deprecated)

1674 The bar code is deprecated in this version of the Standard. In a future version of this
1675 Standard, the bar code may be removed. If used, a linear 3 of 9 bar code SHALL
1676 be placed in the area depicted in [Figure 4-8](#). It SHALL be in accordance with
1677 Association for Automatic Identification and Mobility (AIM) standards. Beginning
1678 and end points of the bar code will depend on the embedded contactless module
1679 selected. Departments and agencies are encouraged to coordinate placement of the bar
1680 code with the card vendor and manufacturer.
1681

Zone 9B and Zone 10B: Agency-Specific Text

1682 In cases in which other defined optional elements are not used, these zones MAY be
1683 used for other department or agency-specific information, as depicted in [Figure 4-8](#).
1684 Departments and agencies SHOULD minimize printed text to that which is absolutely
1685 necessary.
1686

1687 In the case of the Department of Defense, the back of the card will have a distinct
1688 appearance as depicted in [Figure 4-8](#). This is necessary to display information required by
1689 the Geneva Accord and to facilitate legislatively mandated medical entitlements.

4.1.5 Color Representation

1690
1691 [Table 4-2](#) provides quantitative specifications for colors in four different color systems:
1692 sRGB Tristimulus [[IEC 61966](#)], sRGB [[IEC 61966](#)], CMYK (Cyan, Magenta, Yellow,
1693 and Key or 'black'), and PANTONE®. Note the PANTONE® color cue mapping is
1694 approximate and will not produce an exact match. An agency or department MAY use
1695 the PANTONE® mappings in cases where the exact color scales are not available. Since
1696 the card body is white, the white color-coding is achieved by the absence of printing.
1697 Note that presence of security features, which MAY overlap colored or printed regions,
1698 may modify the perceived color. In the case of colored regions, the effect of overlap
1699 SHALL NOT prevent the recognition of the principal color by a person with normal
1700 vision (corrected or uncorrected) at a working distance of 50 cm to 200 cm.

Table 4-2. Color Representation

Color	Zone	sRGB Tristimulus	sRGB	CMYK	PANTONE®
White	15F	255, 255, 255	255, 255, 255	0, 0, 0, 0	
Green	15F	153, 255, 153	203, 255, 203	40, 0, 40, 0	359 C
Blue	15F	0, 255, 255	0, 255, 255	100, 0, 0, 0	630 C
Red	12F	253, 27, 20	254, 92, 79	0, 90, 86, 0	032 C

All listed measurements are in millimeters originating from the top left corner.

Unless otherwise specified, data labels are printed in 5 pt Arial with the corresponding data printed in 6 pt Arial Bold.

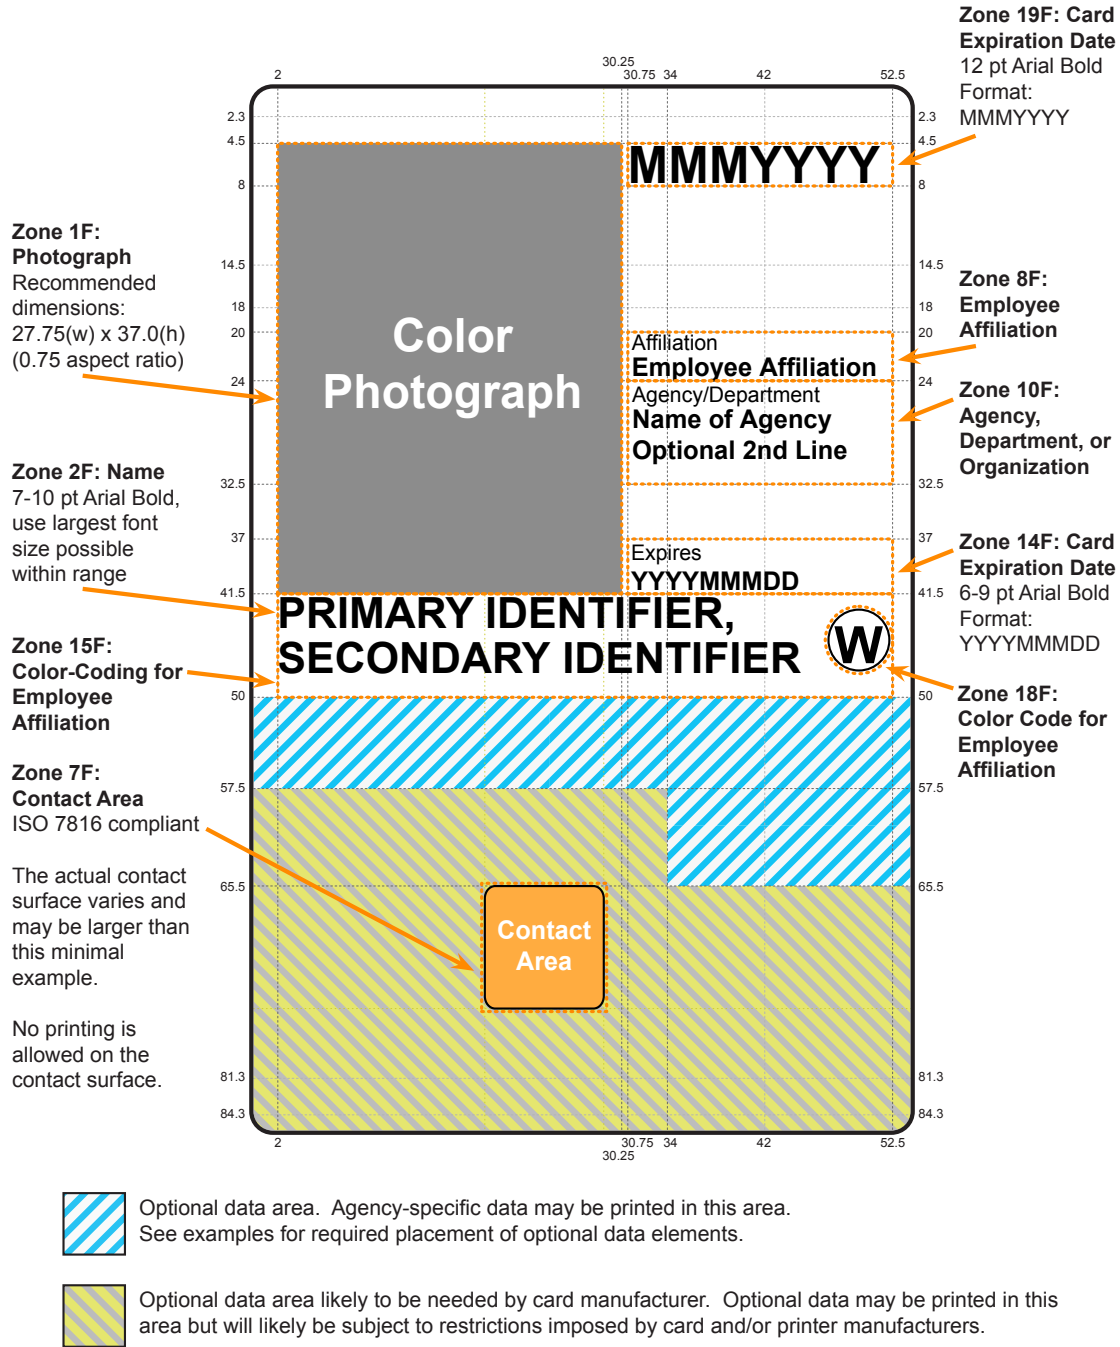

Figure 4-1. Card Front: Printable Areas and Required Data

All listed measurements are in millimeters originating from the top left corner.

Unless otherwise specified, data labels are printed in 5 pt Arial with the corresponding data printed in 6 pt Arial Bold.

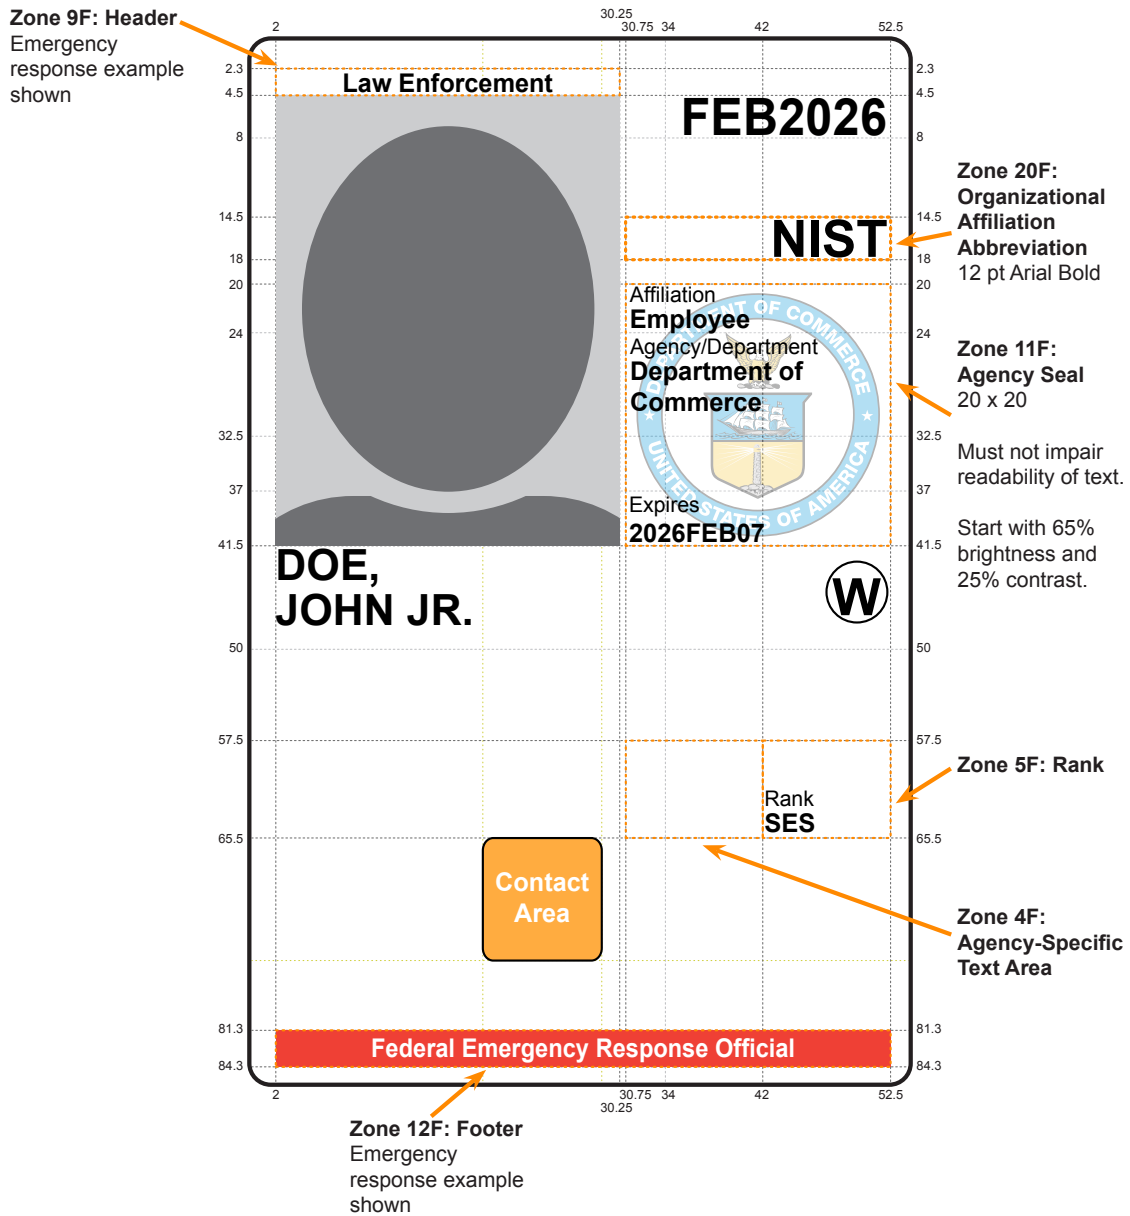

Figure 4-2. Card Front: Optional Data Placement (Example 1)

All listed measurements are in millimeters originating from the top left corner.

Unless otherwise specified, data labels are printed in 5 pt Arial with the corresponding data printed in 6 pt Arial Bold.

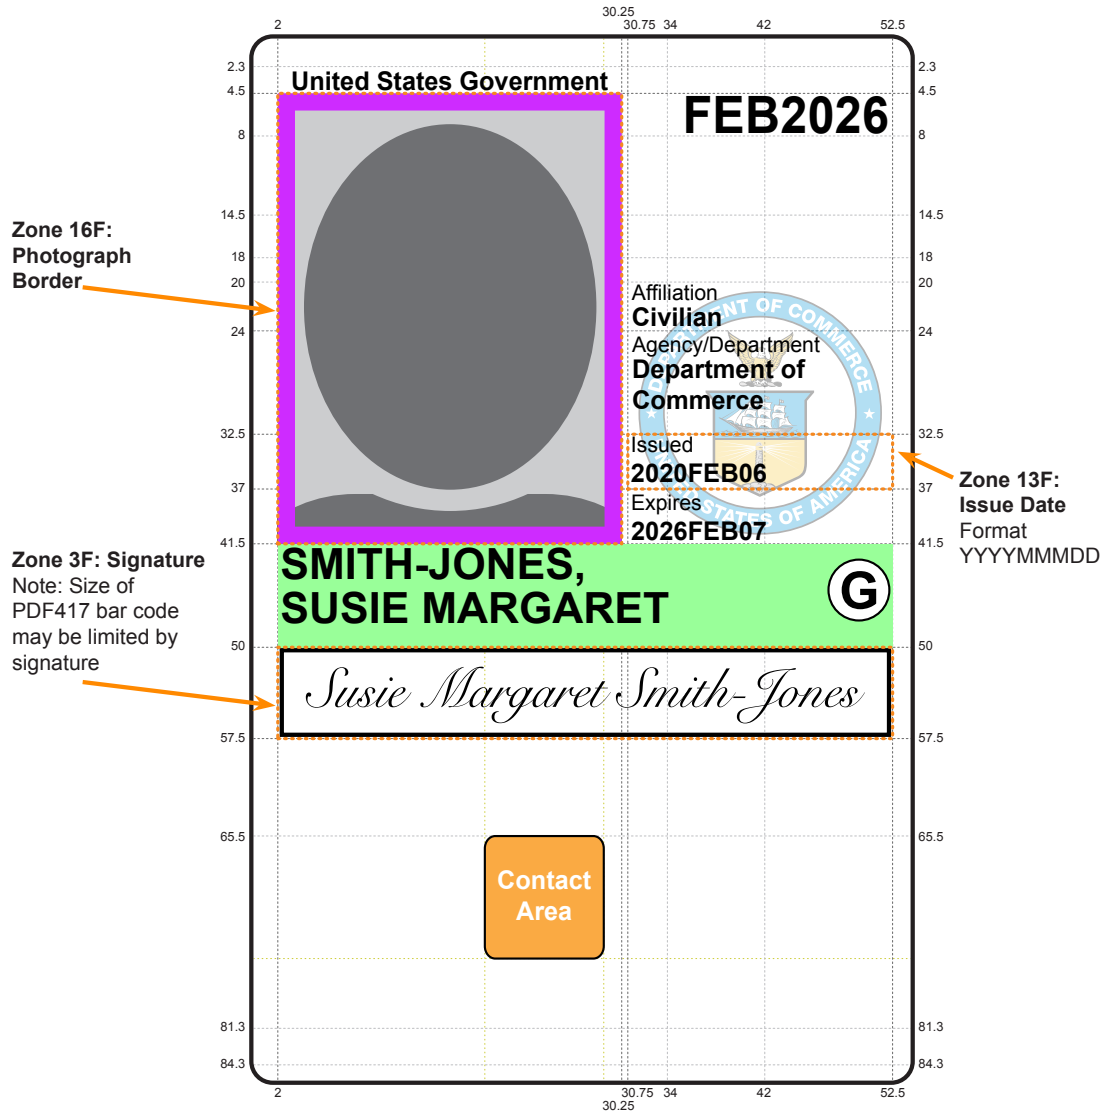

Figure 4-3. Card Front: Optional Data Placement (Example 2)

All listed measurements are in millimeters originating from the top left corner.

Unless otherwise specified, data labels are printed in 5 pt Arial with the corresponding data printed in 6 pt Arial Bold.

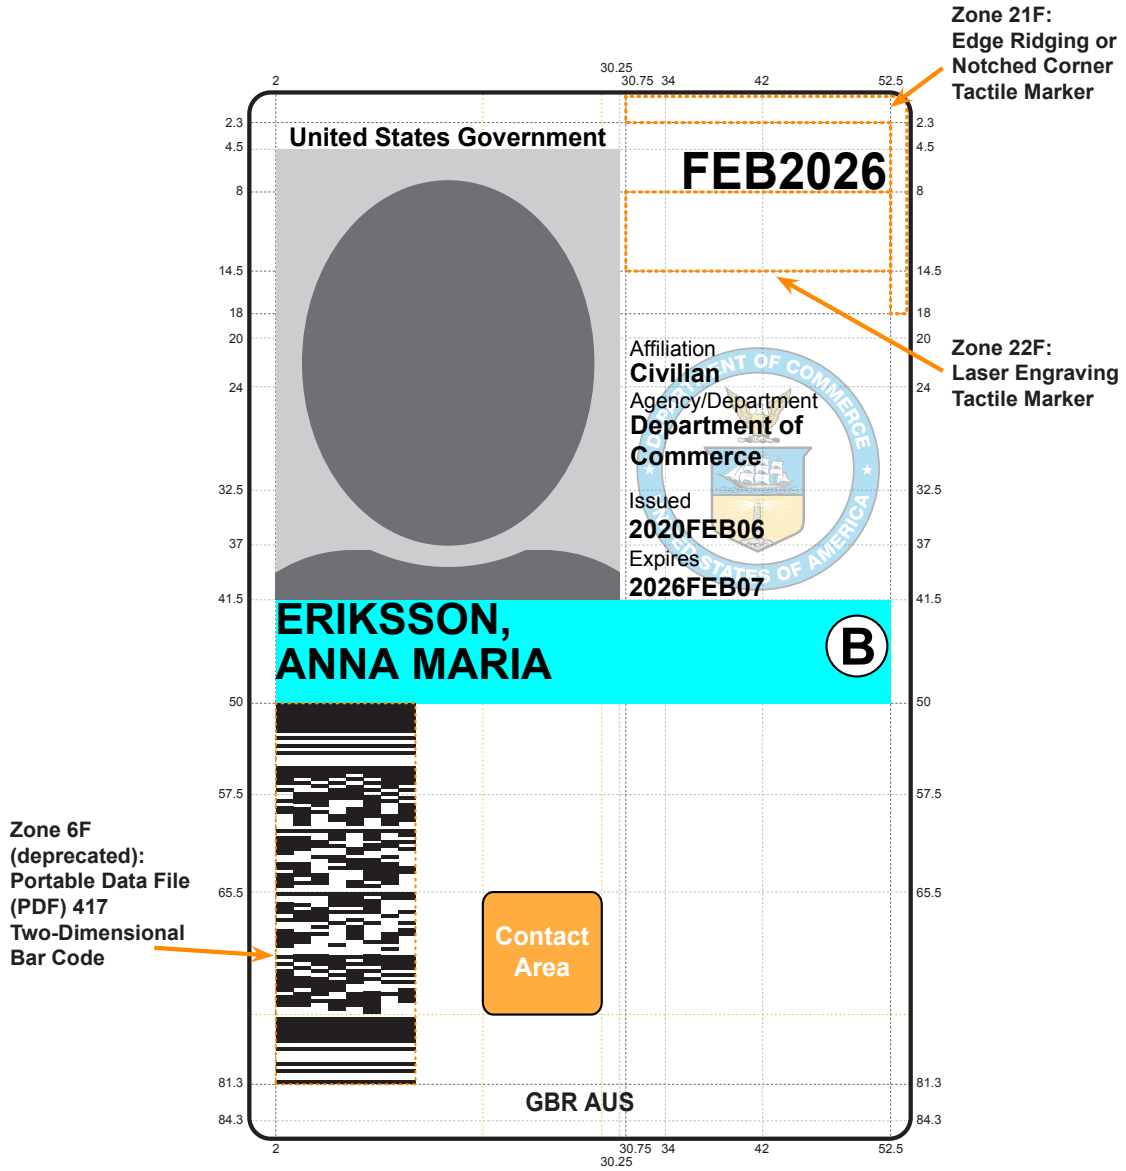

Figure 4-4. Card Front: Optional Data Placement (Example 3)

All listed measurements are in millimeters originating from the top left corner.

Unless otherwise specified, data labels are printed in 5 pt Arial with the corresponding data printed in 6 pt Arial Bold.

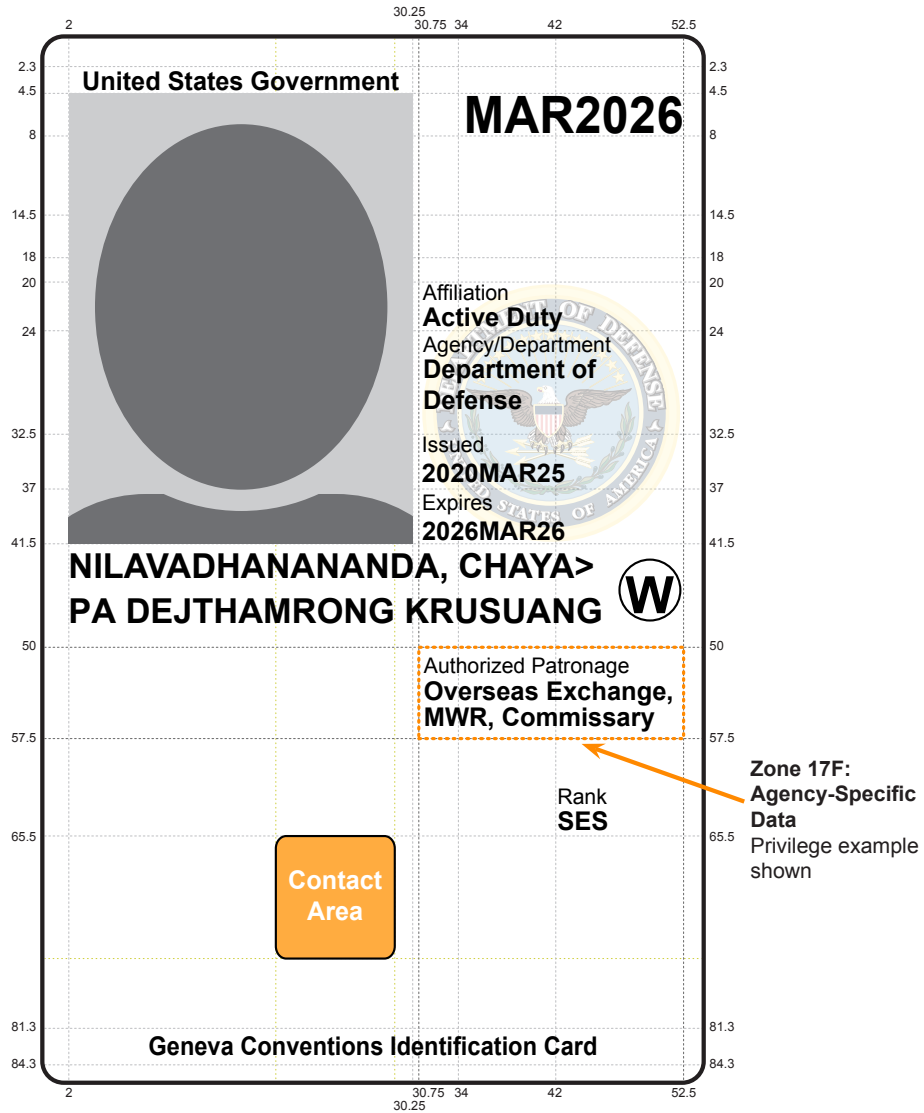

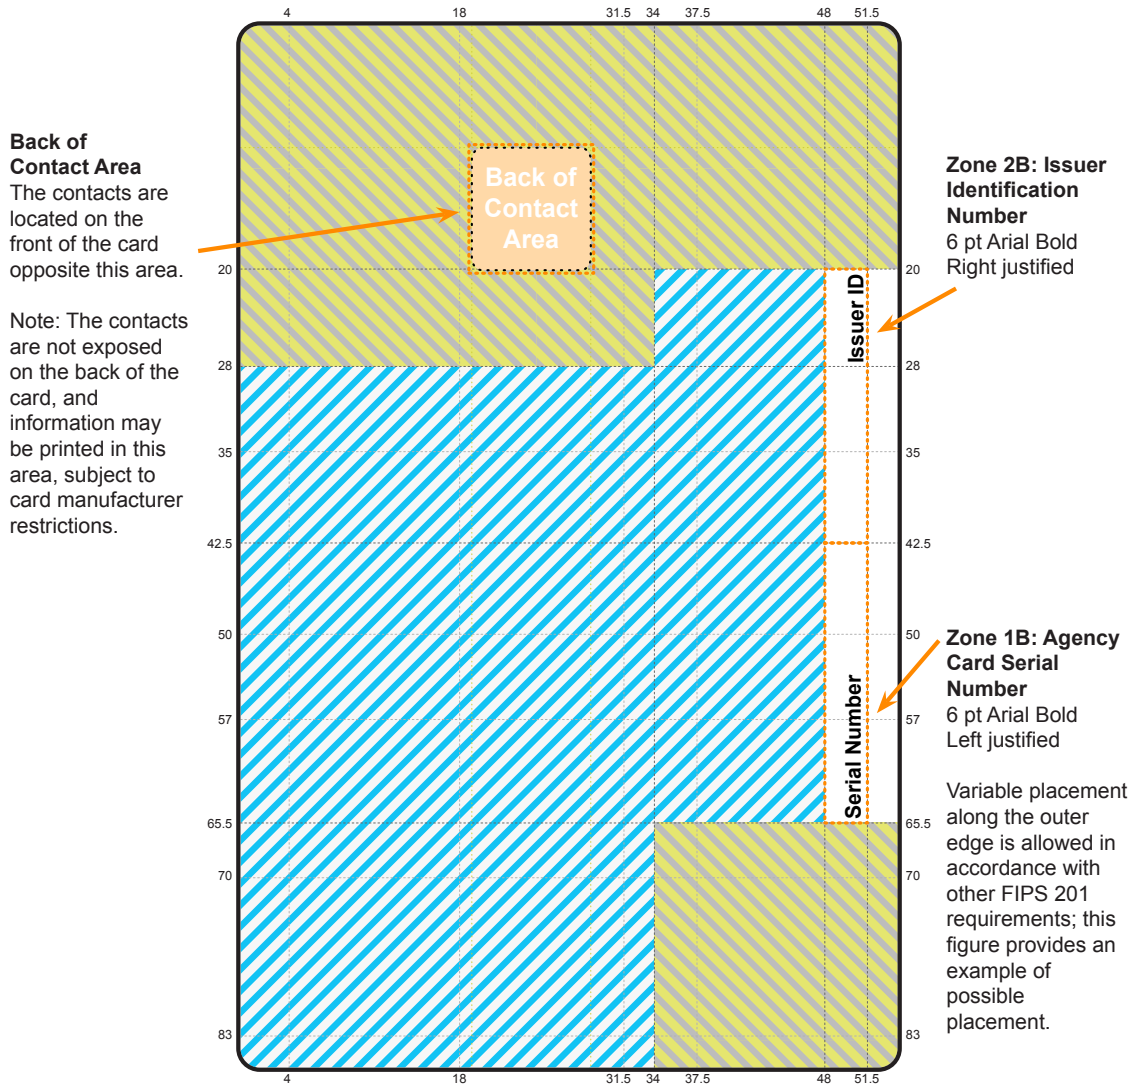

Figure 4-5. Card Front: Optional Data Placement (Example 4)

All listed measurements are in millimeters originating from the top left corner.

Unless otherwise specified, data labels are printed in 5 pt Arial with the corresponding data printed in 6 pt Arial Bold.

Optional data area. Agency-specific data may be printed in this area. See examples for required placement of optional data elements.

Optional data area likely to be needed by card manufacturer. Optional data may be printed in this area but will likely be subject to restrictions imposed by card and/or printer manufacturers.

Figure 4-6. Card Back: Printable Areas and Required Data

All listed measurements are in millimeters originating from the top left corner.

Unless otherwise specified, data labels are printed in 5 pt Arial with the corresponding data printed in 6 pt Arial Bold.

Unless otherwise specified, data labels are printed in 5 pt Arial with the corresponding data printed in 6 pt Arial Bold.

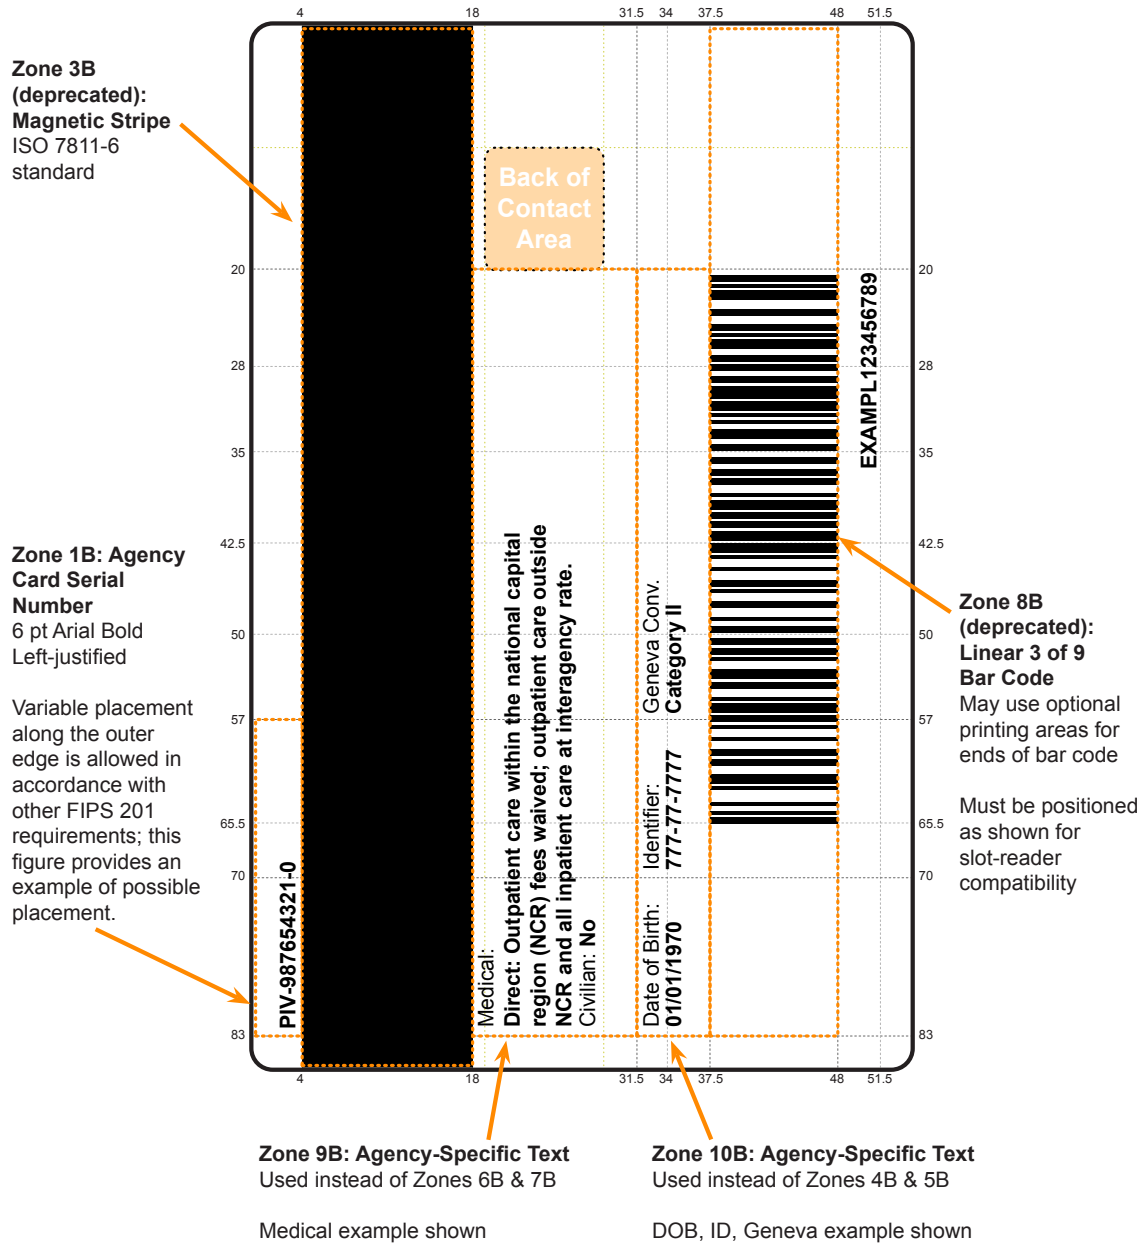

Figure 4-8. Card Back: Optional Data Placement (Example 2)

1701 4.2 PIV Card Logical Characteristics

1702 This section defines the PIV Card's logical identity credentials and the requirements for
1703 use of these credentials.

1704 To support a variety of authentication mechanisms, the PIV Card SHALL contain
1705 multiple data elements for the purpose of verifying the cardholder's identity at graduated
1706 assurance levels. The following mandatory data elements are part of the data model for
1707 PIV Card logical credentials that support authentication mechanisms interoperable across
1708 agencies:

- 1709 • a PIN,
- 1710 • a Cardholder Unique Identifier (CHUID)²²,
- 1711 • PIV authentication data (one asymmetric private key and corresponding certificate),
- 1712 • two fingerprint biometric templates,
- 1713 • an electronic facial image, and
- 1714 • card authentication data (one asymmetric private key and corresponding certificate).

1715 This Standard also defines two data elements for the PIV Card data model that are
1716 mandatory if the cardholder has a government-issued email account at the time of PIV
1717 Card issuance. These data elements are

- 1718 • an asymmetric private key and corresponding certificate for digital signatures, and
- 1719 • an asymmetric private key and corresponding certificate for key management.

1720 This Standard also defines optional data elements for the PIV Card data model. These
1721 optional data elements include

- 1722 • an electronic image of the left iris,
- 1723 • an electronic image of the right iris,
- 1724 • one or two fingerprint biometric templates for OCC,
- 1725 • a symmetric card authentication key for supporting²³ physical access applications,
- 1726 • an asymmetric key to establish secure messaging and authenticate the PIV Card in
1727 support of physical access applications, and
- 1728 • a symmetric PIV Card application administration key associated with the card
1729 management system.

²²The CHUID as an authentication mechanism in [Section 6.2.5](#) has been removed from this version of the Standard. The CHUID data element itself, however, has not been removed and continues to be mandatory as it supports other PIV authentication mechanisms.

²³The symmetric card authentication key has been deprecated in this version of the Standard. Both the symmetric card authentication key and associated SYM-CAK authentication mechanism may be removed in a future revision of the Standard.

1730 Additional data elements are specified in [SP 800-73].

1731 PIV Card logical credentials fall into the following three categories:

1732 **Cardholder-to-Card (CTC) authentication**

1733 Credential elements used to prove the identity of the cardholder to the card, also
1734 known as card activation. Examples include the PIN and the fingerprint biometric
1735 templates for OCC.

1736 **Card-Management-to-Card (CMTC) authentication**

1737 Credential elements used to prove the identity of the card management system to the
1738 card. Examples include the PIV Card application administration key.

1739 **Cardholder-to-External (CTE) authentication**

1740 Credential elements used by the card to prove the identity of the cardholder to an
1741 external entity, such as a host computer system. Examples include the biometric data
1742 records for BIO and BIO-A, symmetric keys, asymmetric keys, and the fingerprint
1743 biometric templates for OCC-AUTH.

1744 **4.2.1 Cardholder Unique Identifier (CHUID)**

1745 Note: The CHUID authentication mechanisms (Section 6.2.5) has been removed from this
1746 version of the Standard. The CHUID data element itself, however, has not been removed
1747 and continues to be mandatory as it supports other PIV authentication mechanisms. For
1748 example, the BIO, BIO-A, and SYM-CAK authentication mechanisms use the CHUID
1749 data element as a source for the card's expiration date. The CHUID data element also
1750 provides the content signing certificate for some authentication mechanisms and unique
1751 identifiers for PACS ACLs.

1752 The PIV Card SHALL include the CHUID, as defined in [SP 800-73]. The CHUID
1753 SHALL include two card identifiers: the Federal Agency Smart Credential Number
1754 (FASC-N) and the card UUID in the Global Unique Identification Number (GUID)
1755 data element of the CHUID. Each identifier uniquely identifies each card as specified
1756 in [SP 800-73]. The value of the card UUID SHALL be a 16 byte binary representation of
1757 a valid UUID as specified in [RFC 4122]. The CHUID SHALL also include an expiration
1758 date data element in machine-readable format that specifies when the card expires. The
1759 expiration date format and encoding rules are as specified in [SP 800-73].

1760 A CHUID MAY also include a Cardholder UUID that represents a persistent identifier of
1761 the cardholder, as specified in [SP 800-73]. The value of the cardholder UUID SHALL be
1762 a 16 byte binary representation of valid UUID, as specified in [RFC 4122].

1763 The CHUID SHALL be accessible from both the contact and contactless interfaces of the
1764 PIV Card without card activation.

1765 The FASC-N, card UUID, and expiration date SHALL NOT be modified post-issuance.

1766 This Standard requires inclusion of the asymmetric signature field in the CHUID
1767 container. The asymmetric signature data element of the CHUID SHALL be encoded
1768 as a Cryptographic Message Syntax (CMS) external digital signature, as specified in
1769 [SP 800-73]. Algorithm and key size requirements for the asymmetric signature and
1770 digest algorithm are detailed in [SP 800-78].

1771 The public key required to verify the digital signature SHALL be contained in a
1772 content signing certificate, which SHALL be issued under the `id-fpki-common-piv-`
1773 `contentSigning` policy of [COMMON]. The content signing certificate SHALL also
1774 include an extended key usage (`extKeyUsage`) extension asserting `id-PIV-content-`
1775 `signing`. The public key SHALL be included in the `certificates` field of the CMS
1776 external digital signature in a content signing certificate. Additional descriptions for the
1777 PIV object identifiers are provided in Appendix B. The content signing certificate SHALL
1778 NOT expire before the expiration of the card authentication certificate.

1779 **4.2.2 Cryptographic Specifications**

1780 The PIV Card SHALL implement the cryptographic operations and support functions
1781 defined in [SP 800-78] and [SP 800-73].

1782 The PIV Card has both mandatory and optional keys:

1783 **PIV authentication key**

1784 A mandatory asymmetric private key that supports card and cardholder authentication
1785 for an interoperable environment. See Section 4.2.2.1.

1786 **Asymmetric card authentication key**

1787 A mandatory private key that supports card authentication for an interoperable
1788 environment. See Section 4.2.2.2.

1789 **Symmetric card authentication key (deprecated)**

1790 Supports card authentication for physical access and is optional. See Section 4.2.2.3.

1791 **Digital signature key**

1792 An asymmetric private key that supports document signing, and it is mandatory if the
1793 cardholder has a government-issued email account at the time of PIV Card issuance.
1794 See Section 4.2.2.4.

1795 **Key management key**

1796 An asymmetric private key that supports key establishment and transport, and it is
1797 mandatory if the cardholder has a government-issued email account at the time of PIV
1798 Card issuance. Optionally, up to 20 retired key management keys may also be stored
1799 on the PIV Card. See Section 4.2.2.5.

1800 **PIV Card application administration key**

1801 An optional symmetric key used for personalization and post-issuance activities. See
1802 [Section 4.2.2.6](#). PIV secure messaging key

1803 An optional asymmetric private key that supports key establishment for secure
1804 messaging and card authentication for physical access.

1805 The PIV Card SHALL store private keys and corresponding public key certificates and
1806 SHALL perform cryptographic operations using the asymmetric private keys. At a
1807 minimum, the PIV Card SHALL store the PIV authentication key, the asymmetric card
1808 authentication key, and the corresponding public key certificates. The PIV Card SHALL
1809 also store a digital signature key, a key management key, and the corresponding public key
1810 certificates unless the cardholder does not have a government-issued email account at the
1811 time of PIV Card issuance.

1812 With the exception of the card authentication key and keys used to establish secure
1813 messaging, cryptographic private key operations SHALL be performed only through the
1814 contact interface or the virtual contact interface. Any operation that MAY be performed
1815 over the contact interface of the PIV Card MAY also be performed over the virtual contact
1816 interface. Requirements for the virtual contact interface are specified in [\[SP 800-73\]](#).

1817 All PIV cryptographic keys SHALL be generated within a cryptographic module with
1818 overall validation at [\[FIPS 140\]](#) Level 2 or above. In addition to an overall validation
1819 of Level 2, the PIV Card SHALL provide Level 3 physical security to protect the PIV
1820 private keys in storage. The scope of the validation for the PIV Card SHALL include all
1821 cryptographic operations performed over both the contact and contactless interfaces

- 1822 • by the PIV Card application;
- 1823 • as part of secure messaging, as specified in this section; and
- 1824 • as part of remote post issuance updates, as specified in [Section 2.9.2](#).

1825 Specific algorithm testing requirements for the cryptographic operations performed by the
1826 PIV Card application are specified in [\[SP 800-78\]](#).

1827 Requirements specific to storage and access for each key are detailed in the following
1828 sections. Where applicable, key management requirements are also specified.

1829 **4.2.2.1 PIV Authentication Key**

1830 This key SHALL be generated on the PIV Card. The PIV Card SHALL NOT permit
1831 exportation of the PIV authentication key. The cryptographic operations that use the
1832 PIV authentication key SHALL be available only through the contact and virtual contact
1833 interfaces of the PIV Card. Private key operations MAY be performed using an activated
1834 PIV Card without explicit user action (e.g., the PIN need not be supplied for each
1835 operation).

1836 The PIV Card SHALL store a corresponding X.509 certificate to support validation
1837 of the public key. The X.509 certificate SHALL include the FASC-N in the Subject
1838 Alternative Name (SAN) extension using the pivFASC-N attribute to support physical
1839 access procedures. The X.509 certificate SHALL also include the card UUID value
1840 from the GUID data element of the CHUID in the SAN extension. The card UUID
1841 SHALL be encoded as a Uniform Resource Name (URN), as specified in Section
1842 3 of [RFC 4122]. The expiration date of the certificate SHALL be no later than the
1843 expiration date of the PIV Card. The PIV authentication certificate MAY include a
1844 PIV background investigation indicator (previously known as the NACI indicator)
1845 extension (see [Appendix B.2](#)). This non-critical extension indicates the status of the
1846 cardholder's background investigation at the time of card issuance. [Section 5](#) of this
1847 document specifies the certificate format and the key management infrastructure for the
1848 PIV authentication key.

1849 **4.2.2.2 Asymmetric Card Authentication Key**

1850 The asymmetric card authentication key MAY be generated on the PIV Card or imported
1851 to the card. The PIV Card SHALL NOT permit exportation of the card authentication
1852 key. Cryptographic operations that use the card authentication key SHALL be available
1853 through the contact and contactless interfaces of the PIV Card. Private key operations
1854 MAY be performed using this key without card activation (e.g., the PIN need not be
1855 supplied for operations with this key).

1856 The PIV Card SHALL store a corresponding X.509 certificate to support validation of the
1857 public key. The X.509 certificate SHALL include the FASC-N in the SAN extension
1858 using the pivFASC-N attribute to support physical access procedures. The X.509
1859 certificate SHALL also include the card UUID value from the GUID data element of
1860 the CHUID in the SAN extension. The card UUID SHALL be encoded as a URN, as
1861 specified in Section 3 of [RFC 4122]. The expiration date of the certificate SHALL be
1862 no later than the expiration date of the PIV Card. [Section 5](#) of this document specifies
1863 the certificate format and the key management infrastructure for asymmetric card
1864 authentication keys.

1865 **4.2.2.3 Symmetric Card Authentication Key (Deprecated)**

1866 The symmetric card authentication key is deprecated in this version of the Standard. Both
1867 the symmetric card authentication key and the associated SYM-CAK authentication
1868 mechanism may be removed in a future revision of the Standard.

1869 If used, the symmetric card authentication key MAY be imported onto the card by the
1870 issuer or be generated on the card. If present, the symmetric card authentication key
1871 SHALL be unique for each PIV Card and SHALL meet the algorithm and key size

1872 requirements stated in [SP 800-78]. If present, cryptographic operations using this
1873 key MAY be performed without card activation (e.g., the PIN need not be supplied for
1874 operations with this key). The cryptographic operations that use the card authentication
1875 key SHALL be available through the contact and contactless interfaces of the PIV Card.
1876 This Standard does not specify key management protocols or infrastructure requirements.

1877 **4.2.2.4 Digital Signature Key**

1878 The PIV digital signature key SHALL be generated on the PIV Card. The PIV Card
1879 SHALL NOT permit exportation of the digital signature key. If this key is present,
1880 cryptographic operations using the digital signature key SHALL be performed using
1881 the contact and virtual contact interfaces of the PIV Card. Private key operations SHALL
1882 NOT be performed without explicit user action, as this Standard requires the cardholder
1883 to authenticate to the PIV Card each time it performs a private key computation with the
1884 digital signature key.²⁴

1885 The PIV Card SHALL store a corresponding X.509 certificate to support validation of the
1886 public key. The expiration date of the certificate SHALL be no later than the expiration
1887 date of the PIV Card. Section 5 of this document specifies the certificate format and the
1888 key management infrastructure for PIV digital signature keys.

1889 **4.2.2.5 Key Management Key**

1890 This key MAY be generated on the PIV Card or imported to the card. If present, the
1891 cryptographic operations that use the key management key SHALL only be accessible
1892 using the contact and virtual contact interfaces of the PIV Card. Private key operations
1893 MAY be performed using an activated PIV Card without explicit user action (e.g., the PIN
1894 need not be supplied for each operation).

1895 The PIV Card SHALL store a corresponding X.509 certificate to support validation of
1896 the public key. Section 5 of this document specifies the certificate format and the key
1897 management infrastructure for key management keys.

1898 **4.2.2.6 PIV Card Application Administration Key**

1899 If present, the PIV Card application administration key SHALL be imported onto the card
1900 by the issuer. If present, the cryptographic operations that use the PIV Card application
1901 administration key SHALL only be accessible using the contact interface of the PIV Card.

²⁴NIST [IR 7863] addresses the appropriate use of PIN caching related to digital signatures.

1902 **4.2.2.7 PIV Secure Messaging Key**

1903 The PIV secure messaging key supports the establishment of secure messaging and
1904 authentication using the SM-AUTH authentication mechanism. If present, the key
1905 SHALL be generated on the PIV Card and SHALL NOT be exported. The cryptographic
1906 operations that use the PIV secure messaging key SHALL be available through the
1907 contact and contactless interfaces of the PIV Card. Private key operations²⁵ can
1908 be performed without access control restrictions. The PIV Card SHALL store a
1909 corresponding secure messaging card verifiable certificate (CVC) to support validation of
1910 the public key by the relying party. The use of the PIV secure messaging key and the CVC
1911 is further specified in [SP 800-73] and [SP 800-78].

1912 When the key is used to establish secure messaging, it enables data and commands
1913 transmitted between the card and an external entity to be both integrity-protected and
1914 encrypted. Secure messaging MAY be used, for example, to enable the use of on-card
1915 biometric comparison. Once secure messaging has been established, a virtual contact
1916 interface MAY be established.

1917 **4.2.3 Biometric Data Specifications**

1918 The PIV front-end subsystem employs biometric verification to automate the recognition
1919 of cardholders based on their biological characteristics. The PIV Card can digitally store
1920 fingerprint, face, and iris biometric characteristics. Techniques for storage, protection, and
1921 access of these biometric data records are outlined in the following sections and explained
1922 in depth in [SP 800-76].

1923 **4.2.3.1 Biometric Data Representation**

1924 The following biometric data SHALL be stored on the PIV Card:

- 1925 • Two fingerprint biometric templates. If no fingerprint images meet the quality
1926 criteria of [SP 800-76], the PIV Card SHALL nevertheless be populated with
1927 fingerprint biometric templates, as specified in [SP 800-76].
- 1928 • An electronic facial image.

1929 The following biometric data MAY also be stored on the PIV Card:

- 1930 • electronic image of the left iris,
- 1931 • electronic image of the right iris, and

²⁵Private key operation with the PIV secure messaging key is defined as the use of the key to establish session keys for secure messaging or the use of key for SM-AUTH card authentication.

- 1932 • fingerprint biometric templates for OCC.²⁶

1933 All biometric data SHALL be stored in the data elements referenced by [SP 800-73] and
1934 in conformance with the preparation and formatting specifications of [SP 800-76].

1935 4.2.3.2 Biometric Data Record Protection

1936 The integrity of all biometric data records, except for fingerprint biometric templates for
1937 OCC, SHALL be protected using digital signatures. The records SHALL be prepended
1938 with a Common Biometric Exchange Formats Framework (CBEFF) header and appended
1939 with the CBEFF signature block [IR 6529-A].

1940 The format for a CBEFF header is specified in [SP 800-76].

1941 The CBEFF signature block contains the digital signature of the biometric data record and
1942 facilitates the verification of integrity of the biometric data record. The CBEFF signature
1943 block SHALL be encoded as a CMS external digital signature as specified in [SP 800-76].
1944 The algorithm and key size requirements for the digital signature and digest algorithm are
1945 detailed in [SP 800-78].

1946 The public key required to verify the digital signature SHALL be contained in a
1947 content signing certificate, which SHALL be issued under the `id-fpki-common-piv-`
1948 `contentSigning` policy of [COMMON]. The content signing certificate SHALL also
1949 include an extended key usage (`extKeyUsage`) extension asserting `id-PIV-content-`
1950 `signing`. If the signature on the biometric data record was generated with a different
1951 key than the signature on the CHUID, the `certificates` field of the CMS external
1952 digital signature SHALL include the content signing certificate required to verify the
1953 signature on the biometric data record. Otherwise, the `certificates` field SHALL be
1954 omitted. Additional descriptions for the PIV object identifiers are provided in Appendix B.
1955 The content signing certificate SHALL NOT expire before the expiration of the card
1956 authentication certificate.

1957 4.2.3.3 Biometric Data Record Access

1958 The biometric data records, except for fingerprint biometric templates for OCC, that are
1959 stored on the card

- 1960 • SHALL be readable through the contact interface only after the presentation of a
1961 valid PIN; and

²⁶The on-card and off-card fingerprint biometric data records are stored separately and, as conformant instances of different formal fingerprint template standards, are syntactically different. This is described more fully in [SP 800-76].

- 1962 • MAY optionally be readable through the virtual contact interface only after the
1963 presentation of a valid PIN.

1964 OCC MAY be performed over the contact and contactless interfaces of the PIV Card to
1965 support card activation (Section 4.3.1) and cardholder authentication (Section 6.2.2). The
1966 fingerprint biometric templates for OCC SHALL NOT be exportable. If implemented,
1967 OCC SHALL be implemented and used in accordance with [SP 800-73] and [SP 800-76].

1968 4.2.4 PIV Unique Identifiers

1969 A cardholder is authenticated using the mechanisms described in Section 6. The
1970 authenticated identity MAY then be used as the basis for making authorization decisions.
1971 Unique identifiers for both authentication and authorization are provided in this Standard
1972 in order to uniquely identify the cardholder. The two types of identifiers that serve as
1973 identification (of the cardholder) for authentication and authorization purposes are as
1974 follows:

1975 Card identifiers

1976 Each PIV Card contains a card UUID and a FASC-N that uniquely identify the card
1977 and, by correspondence, the cardholder. These two card identifiers are represented
1978 in all of the authentication data elements for the purpose of binding the PIV data
1979 elements to the same PIV Card. For example, the card UUID is represented in the
1980 GUID data element of the CHUID, in the entryUUID attribute of CMS-signed
1981 biometric data records and in the subjectAltName extension of PIV authentication
1982 certificates. Similarly, the FASC-N is represented in the CHUID, in the pivFASC-
1983 N attribute of CMS-signed biometric data records, and in the subjectAltName
1984 extension of PIV authentication certificates.

1985 Cardholder identifiers

1986 Other identifiers MAY be present in credentials on the PIV Card that identify the
1987 cardholder rather than the card. Examples include the cardholder UUID that may
1988 appear in the CHUID or the subject names that may appear in the subjectAltName
1989 extension in the PIV authentication certificate.

1990 4.3 PIV Card Activation

1991 The PIV Card SHALL be activated²⁷ to perform privileged²⁸ operations such as using
1992 the PIV authentication key, digital signature key, and key management key. The PIV Card
1993 SHALL be activated for privileged operations only after authenticating the cardholder

²⁷Activation in this context refers to the unlocking of the PIV Card application so that privileged operations can be performed.

²⁸A read of a CHUID or use of the card authentication key is not considered a privileged operation.

1994 or the appropriate card management system. Cardholder activation is described in
1995 [Section 4.3.1](#) and card management system activation is described in [Section 4.3.2](#).

1996 **4.3.1 Activation by Cardholder**

1997 PIV Cards SHALL implement user-based cardholder activation to allow privileged
1998 operations using PIV credentials held by the card. At a minimum, the PIV Card SHALL
1999 implement PIN-based cardholder activation in support of interoperability across
2000 departments and agencies. Other card activation mechanisms as specified in [\[SP 800-73\]](#)
2001 (e.g., OCC card activation) MAY be implemented and SHALL be discoverable. For PIN-
2002 based cardholder activation, the cardholder SHALL supply a numeric PIN. The PIN
2003 SHALL be transmitted to the PIV Card and checked by the card. If the PIN check is
2004 successful, the PIV Card is activated. The PIV Card SHALL include mechanisms to
2005 block activation of the card after a number of consecutive failed activation attempts. A
2006 maximum of 10 consecutive PIN retries SHALL be permitted unless a lower limit is
2007 imposed by the department or agency.

2008 The PIN should not be easily guessable or otherwise individually identifiable in nature
2009 (e.g., part of a Social Security Number or phone number). The PIN SHALL be a
2010 minimum of six digits in length. The PIV Card SHALL compare the chosen PIN against a
2011 list of at least 10 commonly-chosen values (e.g., 000000, 123456) and require the choice
2012 of a different value if one of those is selected by the cardholder.

2013 **4.3.2 Activation by Card Management System**

2014 PIV Cards MAY support card activation by the card management system to support card
2015 personalization and post-issuance card update. To activate the card for personalization or
2016 update, the card management system SHALL perform a challenge response protocol
2017 using cryptographic keys stored on the card in accordance with [\[SP 800-73\]](#). When
2018 cards are personalized, each PIV Card SHALL contain a unique PIV Card application
2019 administration key specific to that PIV Card. PIV Card application administration keys
2020 SHALL meet the algorithm and key size requirements stated in [\[SP 800-78\]](#).

2021 **4.4 Card Reader Requirements**

2022 This section provides minimum requirements for contact and contactless card readers.
2023 This section also provides requirements for PIN input devices. Further card reader
2024 requirements are specified in [\[SP 800-96\]](#).

2025 **4.4.1 Contact Reader Requirements**

2026 Contact card readers SHALL conform to [ISO 7816] for the card-to-reader interface.
2027 These readers SHALL conform to the Personal Computer/Smart Card (PC/SC)
2028 Specification [PCSC] for the reader-to-host system interface in general-purpose desktop
2029 computing systems and SHALL conform to the requirements specified in [SP 800-96].
2030 In systems where the readers are not connected to general-purpose desktop computing
2031 systems, the reader-to-host system interface is not specified in this Standard.

2032 **4.4.2 Contactless Reader Requirements**

2033 Contactless card readers SHALL conform to [ISO 14443] for the card-to-reader interface
2034 and data transmitted over the [ISO 14443] link SHALL conform to [ISO 7816]. In
2035 cases where these readers are connected to general-purpose desktop computing systems,
2036 they SHALL conform to [PCSC] for the reader-to-host system interface and SHALL
2037 conform to the requirements specified in [SP 800-96]. In systems where the readers are
2038 not connected to general-purpose desktop computing systems, the reader-to-host system
2039 interface is not specified in this Standard.

2040 **4.4.3 Reader Interoperability (Removed)**

2041 Note: This section was formerly entitled “Reader Resilience and Flexibility.”

2042 The content of this section has been removed since the PIV middleware specified in
2043 [SP 800-73] adequately covers reader interoperability, resilience, and flexibility for
2044 different PIV systems.

2045 **4.4.4 Card Activation Device Requirements**

2046 When the PIV Card is used with a PIN or OCC data for physical access, the input device
2047 SHALL be integrated with the PIV Card reader. When the PIV Card is used with a PIN
2048 or OCC data for logical access (e.g., to authenticate to a website or other server), the input
2049 device is not required to be integrated with the PIV Card reader. If the input device is not
2050 integrated with the PIV Card reader, the PIN or OCC data SHALL be transmitted securely
2051 and directly to the PIV Card for card activation.

2052 The specifications for fingerprint biometric capture devices for OCC are given in
2053 [SP 800-76].

2054 Malicious code could be introduced into PIN capture and biometric capture devices
2055 for the purpose of compromising or otherwise exploiting the PIV Card. General good
2056 practice to mitigate malicious code threats is outside of the scope of this document (see
2057 [SP 800-53]).

2058 5. PIV Key Management Requirements

2059 *This section is normative.* It defines the processes and components required for managing
2060 a PIV Card's lifecycle and provides the requirements and specifications related to key
2061 management.

2062 PIV Cards consistent with this specification SHALL have two or more asymmetric
2063 private keys. To manage the public keys associated with the asymmetric private keys,
2064 departments and agencies SHALL issue and manage X.509 public key certificates as
2065 specified in this section.

2066 5.1 Architecture

2067 CAs that issue certificates to support PIV private keys SHALL participate in the
2068 hierarchical PKI for the Common Policy managed by the Federal PKI.

2069 CA certificates SHALL conform to [PROF].

2070 5.2 PKI Certificate

2071 All certificates issued to support PIV private keys (i.e., PIV authentication, card
2072 authentication, digital signature, and key management certificates) SHALL be issued
2073 in accordance with [COMMON]. CAs and registration authorities can either be operated
2074 by departments and agencies or be outsourced to PKI service providers. For a list of
2075 PKI service providers that have been approved to operate under [COMMON], see
2076 <https://www.idmanagement.gov>.

2077 Details of the cryptographic properties of PIV keys are found in Section 4.2.2 and its
2078 subsections.

2079 5.2.1 X.509 Certificate Contents

2080 The required contents of X.509 certificates associated with PIV private keys are based on
2081 [PROF]. The relationship is described below:

- 2082 • Certificates that contain the public key associated with a PIV authentication private
2083 key SHALL conform to the *PIV Authentication Certificate Profile* in [PROF] and
2084 SHALL specify the id-fpki-common-authentication policy of [COMMON] in
2085 the certificate policies extension (Section 4.2.2.1).

- 2086 • Certificates that contain the public key associated with an asymmetric card
2087 authentication private key SHALL conform to the *Card Authentication Certificate*
2088 *Profile* in [PROF] and SHALL specify the `id-fpki-common-cardAuth` policy of
2089 [COMMON] in the certificate policies extension (Section 4.2.2.2).
- 2090 • Certificates that contain the public key associated with a digital signature private
2091 key SHALL conform to the *End Entity Signature Certificate Profile* in [PROF] and
2092 SHALL specify the `id-fpki-common-hardware` policy of [COMMON] in the
2093 certificate policies extension (Section 4.2.2.4).
- 2094 • Certificates containing the public key associated with a key management private
2095 key SHALL conform to *Key Management Certificate Profile* in [PROF] and SHALL
2096 specify the `id-fpki-common-policy` or `id-fpki-common-hardware` policy of
2097 [COMMON] in the certificate policies extension (Section 4.2.2.5).
- 2098 • Requirements for algorithms and key sizes for each type of PIV asymmetric key are
2099 given in [SP 800-78].

2100 The expiration date of the PIV authentication and card authentication certificates
2101 SHALL NOT be after the expiration date of the PIV Card. If the card is revoked, the
2102 PIV authentication and card authentication certificates SHALL be revoked in cases
2103 where the card cannot be collected and destroyed. However, a PIV authentication or card
2104 authentication certificate MAY be revoked and subsequently replaced without revoking
2105 the PIV Card. The presence of a valid, unexpired, and unrevoked authentication certificate
2106 on a card is sufficient proof that the card was issued and is not revoked.

2107 **5.3 X.509 Certificate Revocation List (CRL) Contents**

2108 CAs that issue certificates corresponding to PIV private keys SHALL issue CRLs as
2109 specified in [COMMON]. The contents of X.509 CRLs SHALL conform to *CRL Profile*
2110 in [PROF].

2111 **5.4 Legacy PKIs (Removed)**

2112 The content of this section has been removed since [COMMON] provides the
2113 requirements for department and agency CAs that might be issuing cross-certified PIV
2114 authentication certificates and card authentication certificates.

2115 **5.5 PKI Repository and Online Certificate Status Protocol (OCSP)** 2116 **Responders**

2117 CAs that issue certificates corresponding to PIV private keys (i.e., PIV authentication,
2118 card authentication, digital signature, or key management certificates) SHALL

- 2119 • maintain a Hypertext Transfer Protocol (HTTP) accessible service that publishes
2120 the CRLs for the PIV certificates that it issues, as specified in [PROF];
- 2121 • maintain an HTTP-accessible service that publishes any CA certificates issued to it,
2122 as specified in [PROF]; and
- 2123 • operate Online Certificate Status Protocol (OCSP, specified in [RFC 6960]) services
2124 for the PIV certificates that it issues, as specified in [PROF].

2125 PIV authentication, card authentication, digital signature, and key management
2126 certificates SHALL

- 2127 • contain the `crldistributionPoints` extension needed to locate CRLs, and
- 2128 • contain the `authorityInfoAccess` extension needed to locate the authoritative
2129 OCSP responder.

2130 Departments and agencies SHALL notify CAs when certificates need to be revoked.

2131 **5.5.1 Certificate and CRL Distribution**

2132 This Standard requires the distribution of CA certificates and CRLs using HTTP. Specific
2133 requirements are found in [PROF].

2134 Certificates that contain the FASC-N or card UUID in the SAN extension, such as
2135 PIV authentication certificates and card authentication certificates, SHALL NOT be
2136 distributed publicly (e.g., via HTTP accessible from the public internet). Individual
2137 departments and agencies can decide whether digital signature and key management
2138 certificates can be distributed publicly by the CA.

2139 **5.5.2 OCSP Status Responders**

2140 OCSP status responders SHALL be implemented as a certificate status mechanism. The
2141 OCSP status responders SHALL be updated at least as frequently as CRLs are issued.

2142

6. PIV Cardholder Authentication

2143 *This section is normative.* It defines a suite of authentication mechanisms that are
2144 supported by all PIV Cards as well as the applicability of these mechanisms in meeting
2145 the requirements for a set of graduated assurance levels. This section also defines some
2146 authentication mechanisms that make use of credential elements that MAY optionally be
2147 included on PIV Cards. Specific implementation details of authentication mechanisms
2148 identified in this section are provided in [SP 800-73]. Graduated authenticator
2149 assurance levels are also applicable to derived PIV credentials used in accordance with
2150 [SP 800-157].

2151 While this section identifies a wide range of authentication mechanisms, departments and
2152 agencies may adopt additional mechanisms that use the identity credentials on the PIV
2153 Card. In the context of the PIV Card application, authentication is defined as the process
2154 of establishing confidence in the identity of the cardholder presenting a PIV Card. The
2155 authenticated identity can then be used to determine the permissions or authorizations
2156 granted to that identity for access to various physical and logical resources.

2157 The authentication mechanisms in this section describe how to authenticate using the PIV
2158 Card directly. The authenticated identity can also be used to create an identity assertion as
2159 part of a federation protocol, as described in Section 7.

2160 6.1 PIV Assurance Levels

2161 This Standard defines multiple levels of assurance for logical and physical access. Each
2162 assurance level establishes a degree of confidence that the presenter of the PIV Card is the
2163 person referred to by the PIV credential. The entity performing the authentication further
2164 establishes confidence that the person referred to by the PIV credential is a specific person
2165 identified through the rigor of the identity proofing process conducted prior to issuance
2166 of the PIV Card and the security of the PIV Card issuance and maintenance processes
2167 specified in Section 2. The PIV identity proofing, registration, issuance, and maintenance
2168 processes meet or exceed the requirements for IAL3, as defined in [SP 800-63A].

2169 The PIV Card contains a number of logical credentials that are used by the authentication
2170 mechanisms specified in Section 6.2. PIV assurance levels may vary depending on the
2171 PIV authentication mechanism used. The assurance levels for physical and logical access
2172 are specified in Section 6.3.1 and Section 6.3.2, respectively.

2173 Parties responsible for controlling access to federal resources (both physical and logical)
2174 SHALL determine the appropriate assurance levels required for access based on the
2175 harm and impact to individuals and organizations that could occur as a result of errors
2176 in the authentication of the PIV cardholder. Once the required assurance level has been
2177 determined, one of the authentication mechanisms specified in Section 6.2 SHALL be
2178 applied to achieve that assurance level.

2179 **6.1.1 Relationship to Federal Identity Policy (Removed)**

2180 Note: This section was formerly entitled “Relationship to OMB’s E-
2181 Authentication Guidance.”

2182 The content of this section has been removed since OMB [M-04-04] has been rescinded
2183 by OMB [M-19-17], which recognizes the IALs defined in NIST [SP 800-63] as the
2184 framework for managing digital identity risks within the Federal Government. A mapping
2185 between PIV authentication mechanisms and SP 800-63 assurance levels can be found in
2186 [Section 6.3.2](#).

2187 **6.2 PIV Card Authentication Mechanisms**

2188 The following subsections define the basic types of authentication mechanisms that are
2189 supported by the credential set hosted by the PIV Card application. PIV Cards can be
2190 used for authentication in environments that are equipped with contact or contactless card
2191 readers. The usage environment affects the PIV authentication mechanisms that may be
2192 applied to a particular situation.

2193 **6.2.1 Authentication Using Off-Card Biometric One-to-One Comparison**

2194 The PIV Card application hosts the fingerprint biometric templates, electronic facial
2195 image, and optional electronic iris images. These biometric data records can be read
2196 from the card following CTC authentication using a PIN supplied by the cardholder.
2197 The biometric data records are designed to support the CTE authentication mechanism
2198 through an off-card biometric one-to-one comparison scheme. The following subsections
2199 define two authentication mechanisms that make use of biometric data records.²⁹

2200 Some characteristics of the authentication mechanisms using biometric data are as
2201 follows:

- 2202 • strong resistance to use of the PIV Card by a non-owner since both PIN entry and
2203 cardholder biometric characteristics are required
- 2204 • digital signature on biometric data records, which is checked to further strengthen
2205 the mechanism
- 2206 • slower since it requires multiple interactions with the cardholder for presentation of
2207 the PIN and acquisition of a biometric sample

²⁹As noted in [Section 4.2.3.1](#), fingerprint biometric templates are not guaranteed to contain biometric characteristic data since it may not be possible to collect fingerprints from some cardholders. Additionally, electronic iris images are not guaranteed to be present on a PIV Card since iris biometric capture is optional. When biometric verification cannot be performed, PKI-AUTH is the recommended alternate authentication mechanism.

- 2208 • does not provide protection against use of a revoked card
- 2209 • usable with both contact card readers and contactless card readers that support the
- 2210 virtual contact interface

2211 **6.2.1.1 Unattended Authentication Using Biometric Data (BIO)**

2212 The following steps SHALL be performed for unattended authentication using biometric
2213 data:

- 2214 • The CHUID or another data element³⁰ is read from the card. The signature of the
- 2215 CHUID or another data element is verified to ensure that the card has not expired
- 2216 and that the card comes from a trusted source.
- 2217 • The cardholder is prompted to enter a PIN, activating the PIV Card.
- 2218 • The biometric data record is read from the card.
- 2219 • The signature on the biometric data record is verified to ensure that the biometric
- 2220 data record is intact and comes from a trusted source. Note that the signature
- 2221 verification may require retrieval of the content signing certificate from the CHUID
- 2222 if the signature on the biometric data record was generated with the same key as the
- 2223 signature on the CHUID.
- 2224 • The cardholder is prompted to capture a new biometric sample.
- 2225 • If the new biometric sample elicits a positive biometric verification decision, the
- 2226 cardholder is authenticated as the owner of the card.
- 2227 • The FASC-N or the card UUID in the CHUID or other data element is compared
- 2228 with the corresponding element in the signed attributes field of the external digital
- 2229 signature in the biometric data record.
- 2230 • A unique identifier within the CHUID or other data element is used as input to the
- 2231 authorization check to determine whether the cardholder should be granted access.

2232 **6.2.1.2 Attended Authentication Using Biometric Data (BIO-A)**

2233 In this higher assurance variant of BIO, an attendant (e.g., security guard) supervises the
2234 submission of the new biometric sample by the cardholder. Otherwise, the steps for this
2235 authentication mechanism are the same as in [Section 6.2.1.1](#).

³⁰The PIV authentication certificate or card authentication certificate may be leveraged instead of the CHUID to verify that the card is not expired.

2236 **6.2.2 Authentication Using On-Card Biometric One-to-One Comparison (OCC-AUTH)**

2237 The PIV Card application MAY host an optional OCC algorithm. In this case, OCC data
2238 is stored on the card, which cannot be read but could be used for biometric verification.
2239 A fingerprint biometric template is supplied to the card to perform CTC authentication,
2240 and the card responds with a positive or negative biometric verification decision. The
2241 response includes information that allows the reader to authenticate the card. The
2242 cardholder PIN is not required for this operation. The PIV Card SHALL include a
2243 mechanism to block this authentication mechanism after a number of consecutive failed
2244 authentication attempts as stipulated by the department or agency. As with BIO and
2245 BIO-A, if agencies choose to implement OCC, it SHALL be implemented as defined
2246 in [SP 800-73] and [SP 800-76].

2247 Some of the characteristics of OCC-AUTH are as follows:

- 2248 • highly resistant to credential forgery
- 2249 • strong resistance to use of unaltered card by non-owner
- 2250 • usable with contact and contactless card readers

2251 **6.2.3 Authentication Using PIV Asymmetric Cryptography**

2252 The PIV Card contains two mandatory asymmetric authentication private keys and
2253 corresponding certificates to support CTE authentication, as described in Section 4. The
2254 following subsections describe how to perform authentication using the authentication
2255 keys.

2256 **6.2.3.1 Authentication with the PIV Authentication Certificate Credential (PKI-AUTH)**

2257 The following steps SHALL be performed for PKI-AUTH:

- 2258 • The PIV authentication certificate is read from the PIV Card application.
- 2259 • The relying system validates the PIV authentication certificate from the PIV Card
2260 application using certificate path validation specified in [RFC 5280] to ensure that
2261 it is neither expired nor revoked and that it is from a trusted source. Path validation
2262 SHOULD be configured to specify which policy OIDs are trusted.³¹
- 2263 • The cardholder is prompted to enter a PIN, which is used to activate the card. If
2264 implemented, other card activation mechanisms, as specified in [SP 800-73], MAY
2265 be used to activate the card.
- 2266 • The relying system issues a challenge string to the card and requests an asymmetric
2267 operation in response.

³¹The policy OID for the PIV authentication certificate is id-fpki-common-authentication.

- 2268 • The card responds to the previously issued challenge by signing it using the PIV
2269 authentication private key.
- 2270 • The relying system verifies the signature using the public key in the PIV
2271 authentication certificate.
- 2272 • A unique identifier from the PIV authentication certificate is extracted and passed
2273 as input to the authorization check to determine whether the cardholder should be
2274 granted access.

2275 Some of the characteristics of the PKI-based authentication mechanism are as follows:

- 2276 • requires the use of certificate status checking infrastructure
- 2277 • highly resistant to credential forgery
- 2278 • strong resistance to the use of an unaltered card by a non-owner since card
2279 activation is required
- 2280 • protection against the use of a revoked card
- 2281 • usable with both contact card readers and contactless card readers that support the
2282 virtual contact interface

2283 **6.2.3.2 Authentication with the Card Authentication Certificate Credential (PKI-CAK)**

2284 The following steps SHALL be performed for PKI-CAK:

- 2285 • The card authentication certificate is read from the PIV Card application.
- 2286 • The relying system validates the card authentication certificate from the PIV Card
2287 application using certificate path validation specified in [RFC 5280] to ensure that
2288 it is neither expired nor revoked and that it is from a trusted source. Path validation
2289 SHOULD be configured to specify which policy OIDs are trusted.³²
- 2290 • The relying system issues a challenge string to the card and requests an asymmetric
2291 operation in response.
- 2292 • The card responds to the previously issued challenge by signing it using the card
2293 authentication private key.
- 2294 • The relying system verifies the signature using the public key in the card
2295 authentication certificate.
- 2296 • A unique identifier from the card authentication certificate is extracted and passed
2297 as input to the authorization check to determine whether the cardholder should be
2298 granted access.

2299 Some of the characteristics of the PKI-CAK authentication mechanism are as follows:

- 2300 • requires the use of certificate status checking infrastructure,

³²The policy OID for the card authentication certificate is `id-fpki-common-cardAuth`.

- 2301 • highly resistant to credential forgery,
- 2302 • low resistance to use of unaltered card by non-owner, and
- 2303 • usable with contact and contactless readers.

2304 **6.2.3.3 Authentication Using Secure Messaging Key (SM-AUTH)**

2305 The PIV Card MAY include a secure messaging key and corresponding CVC to
2306 establish symmetric keys for use with secure messaging. The same key, CVC, and
2307 key establishment protocol can also be used for authentication, since the PIV Card is
2308 authenticated in the process of establishing secure messaging. Details of the SM-AUTH
2309 authentication mechanism are specified in [SP 800-73] and [SP 800-78].

2310 Some of the characteristics of the secure messaging authentication mechanism are as
2311 follows:

- 2312 • resistant to credential forgery,
- 2313 • does not provide protection against use of a revoked card,
- 2314 • low resistance to the use of an unaltered card by a non-owner, and
- 2315 • usable with contact and contactless readers.

2316 **6.2.4 Authentication Using the Symmetric Card Authentication Key (SYM-CAK)** 2317 **(Deprecated)**

2318 The symmetric card authentication key and associated SYM-CAK authentication
2319 mechanism are deprecated in this version of the Standard. Both the key and the
2320 authentication mechanism may be removed in a future version of this Standard.

2321 If the symmetric card authentication key is present, it SHALL be used for PIV cardholder
2322 authentication using the following steps:

- 2323 • The CHUID, PIV authentication certificate, or card authentication certificate data
2324 element is read from the PIV Card and is checked to ensure that the card has not
2325 expired.
- 2326 • The digital signature on the data element is checked to ensure that it was signed by
2327 a trusted source and is unaltered.
- 2328 • The reader issues a challenge string to the card and requests a response.
- 2329 • The card responds to the previously issued challenge by encrypting the challenge
2330 using the symmetric card authentication key.
- 2331 • The relying system decrypts the card's response with its symmetric key and verifies
2332 that it matches the challenge string sent to the card.

- 2333 • A unique identifier within the data element is used as input to the authorization
2334 check to determine whether the cardholder should be granted access.

2335 Some of the characteristics of the symmetric card authentication key authentication
2336 mechanism are as follows:

- 2337 • resistant to credential forgery,
2338 • does not provide protection against use of a revoked card,
2339 • low resistance to the use of an unaltered card by a non-owner, and
2340 • usable with contact and contactless readers.

2341 **6.2.5 Authentication Using the CHUID (Removed)**

2342 The content of this section has been removed since the CHUID authentication mechanism
2343 is no longer allowed under FIPS-201.

2344 The BIO, BIO-A, and the deprecated SYM-CAK authentication mechanisms use the
2345 CHUID data element as a source for the card's expiration date. The CHUID data element
2346 also provides the content signing certificate for some authentication mechanisms and
2347 unique identifiers for PACS ACLs. Therefore, the CHUID data element remains a
2348 required on-card data element, as described in [Section 4.2.1](#).

2349 **6.2.6 Authentication Using PIV Visual Credentials (VIS) (Deprecated)**

2350 Visual authentication of a PIV cardholder as a stand-alone authentication mechanism
2351 has been deprecated in this version of the Standard. The mechanism provides little or no
2352 assurance of the cardholder's identity and SHOULD NOT be used. It is expected that the
2353 stand-alone use of visual authentication will be removed from this Standard in a future
2354 revision.

2355 The PIV Card has several mandatory features on the front (see [Section 4.1.4.1](#)) and back
2356 (see [Section 4.1.4.2](#)) that support visual identification and authentication:

2357 **Zone 1F**

2358 Photograph

2359 **Zone 2F**

2360 Name

2361 **Zone 8F**

2362 Employee Affiliation

2363 **Zone 10F**

2364 Agency, Department, or Organization

2365 **Zones 14F and 19F**
2366 Card Expiration Date

2367 **Zone 15F**
2368 Color-Coding for Employee Affiliation

2369 **Zone 1B**
2370 Agency Card Serial Number

2371 **Zone 2B**
2372 Issuer Identification Number

2373 In addition, any available security features described in [Section 4.1.2](#) SHOULD be
2374 checked in a visual inspection to provide additional assurance that the PIV Card is
2375 genuine and unaltered.

2376 The PIV Card may also have several optional components on the front (see
2377 [Section 4.1.4.3](#)) and back (see [Section 4.1.4.4](#)) that support visual identification and
2378 authentication, such as:

2379 **Zone 3F**
2380 Signature

2381 **Zone 11F**
2382 Agency Seal

2383 **Zone 5B**
2384 Physical Characteristics of Cardholder

2385 When a cardholder attempts to pass through an access control point for a federally
2386 controlled facility, a human guard SHALL perform visual identity verification of
2387 the cardholder and SHALL determine whether the identified individual should be
2388 allowed through the control point. The following steps SHALL be applied in the visual
2389 authentication process:

- 2390 • The guard at the access control entry point determines whether the PIV Card
2391 appears to be genuine and has not been altered in any way.
- 2392 • The guard compares the cardholder's facial features with the photograph on the card
2393 to ensure that they match.
- 2394 • The guard checks the expiration date on the card to ensure that the card has not
2395 expired.
- 2396 • The guard compares the cardholder's physical characteristic descriptions to those of
2397 the cardholder. (Optional)
- 2398 • The guard collects the cardholder's signature and compares it with the signature on
2399 the card. (Optional)

- 2400 • One or more of the other data elements on the card (e.g., name, employee affiliation,
2401 agency card serial number, issuer identification, agency name) are used to
2402 determine whether the cardholder should be granted access.

2403 Some characteristics of the visual authentication mechanism include the following:

- 2404 • human inspection of the card,
2405 • not amenable for rapid or high-volume access control,
2406 • susceptible to human error,
2407 • some resistance to the use of an unaltered card by a non-owner,
2408 • low resistance to tampering and forgery, and
2409 • does not provide protection against the use of a revoked card.

2410 **6.3 PIV Support of Graduated Authenticator Assurance Levels**

2411 The PIV Card supports a set of authentication mechanisms that can be used to implement
2412 graduated assurance levels. The assurance levels used within this Standard are closely
2413 aligned with NIST [SP 800-63], which specifies a digital identity risk management
2414 process that is cited by OMB [M-19-17].

2415 The following subsections specify which PIV authentication mechanisms CAN be used to
2416 support the various authenticator assurance levels described in this section. Two or more
2417 authentication mechanisms MAY be applied in unison to achieve additional assurance of
2418 the identity of the PIV cardholder. For example, PKI-AUTH and BIO may be applied in
2419 unison to achieve additional assurance of cardholder identity.

2420 Adequately designed and implemented relying systems can achieve the PIV Card
2421 assurance levels stated in Table 6-1 for physical access and Table 6-2 for logical access.
2422 Relying systems that are inadequately designed or implemented may only achieve
2423 lower assurance levels. The design of the components of relying systems—including
2424 card readers, biometric capture devices, cryptographic modules, and key management
2425 systems—involves many factors not fully specified by FIPS 201, such as correctness of
2426 the functional mechanism, physical protection of the mechanism, and environmental
2427 conditions at the authentication point. Additional standards and best practice guidelines
2428 (e.g., [SP 800-53], [FIPS 140], and [SP 800-116]) apply to the design and implementation
2429 of relying systems.

2430 **6.3.1 Physical Access**

2431 The PIV Card can be used to authenticate the cardholder in a physical access control
2432 environment.

2433 The three levels of authentication assurance for physical access, referred to as the Physical
2434 Assurance Level (PAL), are defined as:

2435 **PAL1**

2436 Formerly SOME confidence in the asserted identity's validity (weakest).

2437 **PAL2**

2438 Formerly HIGH confidence in the asserted identity's validity.

2439 **PAL3**

2440 Formerly VERY HIGH confidence in the asserted identity's validity (strongest).

2441 Selection of the PAL SHALL be made in accordance with the applicable policies for
2442 a facility's security level [RISK-MGMT-FACILITIES]. Additional guidelines for the
2443 selection and use of PIV authentication mechanisms for facility access can be found in
2444 NIST [SP 800-116].

2445 The PIV-supported authentication mechanisms for physical access control systems are
2446 summarized in Table 6-1. An authentication mechanism that is suitable for a higher
2447 assurance level can also be applied to meet the requirements for a lower assurance level.
2448 Moreover, the authentication mechanisms in Table 6-1 can be combined to achieve higher
2449 assurance levels.³³

Table 6-1. Applicable PIV Authentication Mechanisms for Physical Access

Physical Assurance Level	Applicable PIV Authentication Mechanisms
PAL1	PKI-CAK, SYM-CAK
PAL2	BIO
PAL3	BIO-A, OCC-AUTH, PKI-AUTH

³³Combinations of authentication mechanisms are specified in [SP 800-116].

2450 **6.3.2 Logical Access**

2451 The PIV Card can be used to authenticate the cardholder in support of decisions regarding
 2452 access to logical information resources. For example, a cardholder may log in to their
 2453 department or agency network using the PIV Card; the identity established through
 2454 this authentication process can be used to determine access to information systems and
 2455 applications available on the network.

2456 Selection of required AAL SHALL be made using the risk management process specified
 2457 in [SP 800-63].

2458 [Table 6-2](#) describes the authentication mechanisms defined for this Standard to support
 2459 logical access control. An authentication mechanism that is suitable for a higher
 2460 assurance level can also be applied to meet the requirements for a lower assurance level.

Table 6-2. Applicable PIV Authentication Mechanisms for Logical Access

Required Authenticator Assurance Level	Local Workstation Environment	Remote/Network System Environment
AAL1	PKI-CAK	PKI-CAK
AAL2	BIO	
AAL3	BIO-A, OCC-AUTH, PKI-AUTH	PKI-AUTH

2461 **7. Federation Considerations for PIV**

2462 *This section is normative.* It defines a set of mechanisms for using federation technologies
2463 to interoperate with PIV and derived PIV credentials issued by other agencies.

2464 Federation protocols allow a trusted IdP to assert a cardholder's identity to an RP across a
2465 network in a secure and verifiable fashion, even if the PIV Card or derived PIV credential
2466 has been issued by another agency. The processes and requirements for federation systems
2467 are discussed in depth in [SP 800-63C].

2468 **7.1 Connecting PIV to Federation**

2469 When using a federation protocol, the PIV Card or derived PIV credential is not directly
2470 presented to the relying subsystem. Instead, the PIV Card or derived PIV credential
2471 SHALL be used to authenticate the PIV cardholder to the IdP of a federation system.³⁴
2472 The IdP SHALL associate this login with the PIV account of the cardholder and SHALL
2473 create an assertion representing the cardholder to be sent to the RP, including attributes
2474 of the cardholder stored in the PIV account. Upon receipt, the RP SHALL validate
2475 the assertion and use the attributes provided in the assertion to match the cardholder
2476 information to the information on record, as discussed in Section 3.1.3. The connections
2477 and components of a federated protocol are shown in Figure 3-4.

2478 Note that processing the PIV Card's PKI-based certificate directly is not a form of
2479 federation as defined by [SP 800-63C], since the certificates on the PIV Card do not meet
2480 the requirements of an assertion. In particular, while an assertion is a short-lived message
2481 created specifically for a federation transaction, the certificate is long-lived and intended
2482 to be presented to many different RPs over time.

2483 **7.2 Federation Assurance Level (FAL)**

2484 [SP 800-63] defines three dimensions of assurance: IAL, AAL, and FAL. The use of a
2485 PIV credential or a derived PIV credential for authentication in a federation transaction
2486 will determine the IAL and AAL of that transaction, but the FAL is determined
2487 independently of the credential itself. As with all credentials, the PIV credential MAY
2488 be used with any FAL, regardless of the IAL and AAL that the credential represents.
2489 Guidance for determining the correct FAL for a given application is available in
2490 [SP 800-63].

2491 The IAL, AAL, and FAL SHALL be known to the RP during the federation transaction.
2492 This information MAY be pre-established or the IdP MAY communicate this at runtime in
2493 the assertion. For example, the information can be presented using technologies defined
2494 in [RFC 8485] or [SAML-AC].

³⁴The IdP is usually operated by the issuer of the PIV Card or derived PIV credential.

2495 **7.3 Benefits of Federation**

2496 While it is possible to directly process a PIV credential that belongs to a different agency,
2497 federation is the recommended way for an agency to accept and process PIV credentials
2498 from other agencies.

2499 Benefits of using a federation protocol to present a PIV credential include the following:

2500 **Federation attributes**

2501 The assertion attributes are more dynamic in nature than the fixed attributes in PIV
2502 credentials. They can be adapted to the needs of the RP and further tailored (e.g.,
2503 selective disclosure of attributes per-provider to preserve privacy).

2504 **Stable identifier**

2505 The identifier in the assertion IdP is stable across multiple certificates over time and
2506 can be associated with all of the cardholder's authenticators.

2507 **Simplicity**

2508 Processing of a federation protocol is simpler for the RP since credential validation
2509 and management are tasked to the credential issuer/IdP. This is further exemplified
2510 by the use of federation technologies to provide authentication and authorization to
2511 mobile applications, smart devices, and other non-traditional applications.

2512 **Appendix A. PIV Validation, Certification, and Accreditation**

2513 *This appendix is normative.* It provides compliance requirements for PIV validation,
2514 certification, and accreditation.

2515 **A.1 Accreditation of PIV Card Issuers (PCI) and Derived PIV Credential** 2516 **Issuers (DPCI)**

2517 [HSPD-12] requires that PIV credentials be issued by providers whose reliability has
2518 been established by an official accreditation process. Consistent assessment guidelines
2519 are established for PIV Card Issuers (PCI) and Derived PIV Credential Issuers (DPCI)
2520 in [SP 800-79], which SHALL be followed by all credential issuers in order to achieve
2521 accreditation.

2522 The entire spectrum of activities in the PCI and DPCI accreditation methodology is
2523 divided into the following four phases:

- 2524 • initiation,
- 2525 • assessment,
- 2526 • accreditation, and
- 2527 • monitoring.

2528 The initiation phase involves communicating the goals of the assessment/accreditation to
2529 the key personnel of the PCI and DPCI organization and the review of documents, such as
2530 the PCI and DPCI operations plan. In the assessment phase, the appropriate assessment
2531 methods stipulated in the methodology for each PCI/DPCI and control are carried out
2532 and the individual results recorded. The accreditation phase involves aggregating the
2533 results of assessment, arriving at an accreditation decision, and issuing the appropriate
2534 notification—the Authorization to Operate (ATO) or the Denial of Authorization to
2535 Operate (DATO)—that is consistent with the accreditation decision.

2536 **A.2 Application of Risk Management Framework to IT Systems** 2537 **Supporting PCI**

2538 The accreditation of the capability and reliability of a PCI and DPCI using the
2539 methodology outlined in [SP 800-79] depends on adequate security for the information
2540 systems that are used for PCI and DPCI functions. The assurance that such a security
2541 exists in a PCI and DPCI is obtained through evidence of the application of the Risk
2542 Management Framework guidelines specified in [SP 800-37]. The methodology in
2543 [SP 800-37] was, in turn, created pursuant to a mandate in Appendix III of Office of
2544 Management and Budget (OMB) Circular [A-130]. An information system authorization

2545 decision, together with evidence of security control monitoring compliant with
2546 [SP 800-37] guidelines, signifies that a PCI/DPCI organization's official accepts
2547 responsibility for the security (in terms of confidentiality, integrity, and availability
2548 of information) of the information systems that will be involved in carrying out the
2549 PCI/DPCI functions. Hence, evidence of successful application of the Risk Management
2550 Framework consistent with [SP 800-37] guidelines is mandatory for issuing PCI/DPCI
2551 accreditation using [SP 800-79].

2552 **A.3 Conformance Testing of PIV Card Application and Middleware**

2553 Assurance of conformance of the PIV Card application interface to this Standard
2554 and its associated technical specifications is needed in order to meet the security
2555 and interoperability goals of [HSPD-12]. To facilitate this, NIST has established the
2556 NIST Personal Identity Verification Program (NPIVP). Under this program, NIST has
2557 developed test procedures in [SP 800-85A] and an associated toolkit for conformance
2558 testing of PIV Card applications. NPIVP conformance testing also includes PIV
2559 middleware, but conformance testing may be discontinued at a future time since computer
2560 operating systems increasingly provide built-in support for smart cards.

2561 Commercial products under these two categories are tested by the set of test laboratories
2562 accredited under the National Voluntary Laboratory Accreditation Program (NVLAP)
2563 program using the NIST-supplied test procedures and toolkit. The outcomes of the test
2564 results are validated by NIST, which then issues validation certificates. Information about
2565 NPIVP is available at [https://csrc.nist.gov/projects/nist-s-personal-identity-verification-](https://csrc.nist.gov/projects/nist-s-personal-identity-verification-program)
2566 [program](https://csrc.nist.gov/projects/nist-s-personal-identity-verification-program).

2567 **A.4 Cryptographic Testing and Validation**

2568 All on-card cryptographic modules that host the PIV Card application and cryptographic
2569 modules of card issuance and maintenance systems SHALL be validated to [FIPS 140]
2570 with an overall Security Level 2 (or higher). The facilities for [FIPS 140] testing
2571 are the Cryptographic and Security Testing Laboratories accredited by the NVLAP
2572 program of NIST. Vendors who want to supply cryptographic modules can select any
2573 of the accredited laboratories. The tests that these laboratories conduct for all vendor
2574 submissions are validated, and a validation certificate for each vendor module is issued
2575 by the Cryptographic Module Validation Program (CMVP), a joint program run by NIST
2576 and the Communications Security Establishment (CSE) of the Government of Canada.
2577 The details of the CMVP and NVLAP programs and the list of testing laboratories can
2578 be found at the CMVP website, [https://csrc.nist.gov/projects/cryptographic-module-](https://csrc.nist.gov/projects/cryptographic-module-validation-program)
2579 [validation-program](https://csrc.nist.gov/projects/cryptographic-module-validation-program).

2580 **A.5 FIPS 201 Evaluation Program**

2581 In order to evaluate the conformance of specialized products that support the PIV
2582 functionality to this Standard and its associated technical specifications, GSA established
2583 the FIPS 201 Evaluation Program. The product families may include the card products
2584 tested under the PIV Validation Program, physical access control systems, or other
2585 products as needed. Products evaluated and approved under this process are placed
2586 on the FIPS 201 Approved Products List to promote the procurement of conformant
2587 products by implementing agencies. The details of the program are available at [https:](https://www.idmanagement.gov/)
2588 [//www.idmanagement.gov/](https://www.idmanagement.gov/).

2589 **Appendix B. PIV Object Identifiers and Certificate Extension**

2590 *This appendix is normative.* It provides additional details for the PIV objects identified in
 2591 [Section 4](#).

2592 **B.1 PIV Object Identifiers**

2593 [Table B-1](#), [Table B-2](#), and [Table B-3](#) list details for PIV object identifiers.

Table B-1. PIV Object Identifiers for PIV eContent Types

ID	Object Identifier	Description
id-PIV-CHUIDSecurityObject	2.16.840.1.101.3.6.1	The associated content is the concatenated contents of the CHUID, excluding the asymmetric signature field.
id-PIV-biometricObject	2.16.840.1.101.3.6.2	The associated content is the concatenated CBEFF_HEADER + STD_BIOMETRIC_RECORD.

Table B-2. PIV Object Identifiers for PIV Attributes

ID	Object Identifier	Description
pivCardholder-Name	2.16.840.1.101.3.6.3	The attribute value is of type DirectoryString and specifies the PIV cardholder’s name.
pivCardholder-DN	2.16.840.1.101.3.6.4	The attribute value is an X.501 type Name and specifies the DN associated with the PIV cardholder in the PIV certificates.
pivSigner-DN	2.16.840.1.101.3.6.5	The attribute value is an X.501 type Name and specifies the subject name that appears in the PKI certificate for the entity that signed the biometric data record or CHUID.
pivFASC-N	2.16.840.1.101.3.6.6	The pivFASC-N OID MAY appear as an X.501 type Name in the otherName field of the Subject Alternative Name extension of X.509 certificates or a signed attribute in CMS external signatures. Where used as an X.501 type Name, the syntax is OCTET STRING. Where used as an attribute, the attribute value is of type OCTET STRING. In each case, the value specifies the FASC-N of the PIV Card.

Table B-3. PIV Object Identifiers for PIV Extended Key Usage

ID	Object Identifier	Description
id-PIV-content-signing	2.16.840.1.101.3.6.7	This specifies that the public key MAY be used to verify signatures on CHUIDs and biometric data records.
id-PIV-cardAuth	2.16.840.1.101.3.6.8	This specifies that the public key is used to authenticate the PIV Card rather than the PIV cardholder.

2594 The OIDs for certificate policies are specified in [COMMON].

2595 **B.2 PIV Background Investigation Indicator Certificate Extension** 2596 **(Deprecated)**

2597 The PIV background investigation indicator (previously known as the NACI indicator) is
2598 deprecated under this version of the Standard, and it is expected that the indicator will be
2599 removed from a future revision. Instead of the on-card indicator, background investigative
2600 status is commonly maintained in each agency IDMS and personnel security system as
2601 well as in the Central Verification System (or successor). Status of the investigation can be
2602 communicated as needed using federation protocols.

2603 If used, the PIV background investigation indicator extension indicates to the issuer
2604 whether the subject's background investigation was incomplete at the time of credential
2605 issuance. The PIV background investigation indicator extension is always non-critical.
2606 The value of this extension is asserted as follows:

- 2607 • TRUE if, at the time of credential issuance, (1) the FBI National Criminal History
2608 Fingerprint Check has completed, and (2) a background investigation has been
2609 initiated but has not completed.
- 2610 • FALSE if, at the time of credential issuance, the subject's background investigation
2611 has been completed and successfully adjudicated.

2612 The PIV background investigation indicator extension is identified by the `id-piv-NACI`
2613 object identifier. The syntax for this extension is defined by the following ASN.1 module:

```
2614 PIV-Cert-Extensions { 2 16 840 1 101 3 6 10 1 }
2615 DEFINITIONS EXPLICIT TAGS ::=
2616 BEGIN
2617 -- EXPORTS ALL --
2618 -- IMPORTS NONE --
2619 id-piv-NACI OBJECT IDENTIFIER ::= { 2 16 840 1 101 3 6 9 1 }
2620 NACI-indicator ::= BOOLEAN
2621 END
```

2622 **Appendix C. Glossary of Terms, Acronyms, and Notations**

2623 *This appendix is informative.* It describes the vocabulary and textual representations used
2624 in the document.

2625 **C.1 Glossary of Terms**

2626 The following terms are used throughout this Standard.

2627 **Access Control**

2628 The process of granting or denying specific requests to 1) obtain and use information
2629 and related information processing services and 2) enter specific physical facilities
2630 (e.g., federal buildings, military establishments, border crossing entrances).

2631 **Applicant**

2632 An individual applying for a *PIV Card* or *derived PIV credential*. The applicant may
2633 be a current or prospective federal hire, a federal employee, or a contractor.

2634 **Application**

2635 A hardware/software system implemented to satisfy a particular set of requirements.
2636 In this context, an application incorporates a system used to satisfy a subset of
2637 requirements related to the verification or identification of an end user's *identity* so
2638 that the end user's *identifier* can be used to facilitate the end user's interaction with the
2639 system.

2640 **Architecture**

2641 A highly structured specification of an acceptable approach within a framework
2642 for solving a specific problem. An architecture contains descriptions of all the
2643 *components* of a selected, acceptable solution while allowing certain details of
2644 specific *components* to be variable to satisfy related constraints (e.g., costs, local
2645 environment, user acceptability).

2646 **Assertion**

2647 A verifiable statement from an IdP to an RP that contains information about an end
2648 user. Assertions may also contain information about the end user's *authentication*
2649 event at the IdP.

2650 **Asymmetric Keys**

2651 Two related *keys*—a *public key* and a *private key*—that are used to perform
2652 complementary operations, such as encryption and decryption or signature generation
2653 and signature verification.

2654 Authentication

2655 The process of establishing confidence of authenticity; in this case, the validity of a
2656 person's *identity* and an authenticator (e.g., *PIV Card* or *derived PIV credential*).

2657 Authenticator Assurance Level (AAL)

2658 A measure of the strength of an *authentication* mechanism and, therefore, the
2659 confidence in it, as defined in [SP 800-63] in terms of three levels:

2660 AAL1

2661 SOME confidence

2662 AAL2

2663 HIGH confidence

2664 AAL3

2665 VERY HIGH confidence

2666 Biometric Authentication (BIO, BIO-A)

2667 A form of *authentication* in which authenticity is established by *biometric verification*
2668 of a new *biometric sample* from a *cardholder* to a *biometric data record* read from the
2669 *cardholder's* activated *PIV Card*. In *BIO*, the biometric sample may be captured from
2670 the *cardholder* in isolation, while in *BIO-A*, an attendant must oversee the process of
2671 *biometric capture*.

2672 Biometric Capture Device

2673 Device that collects a signal from a *biometric characteristic* and converts it to a
2674 captured biometric sample. [ISO 2382-37]

2675 Biometric Characteristic

2676 Biological attribute of an individual from which distinctive and repeatable values can
2677 be extracted for the purpose of automated recognition. Fingerprint ridge structure and
2678 face topography are examples of biometric characteristics [ISO 2382-37].

2679 Biometric Data

2680 Biometric sample or aggregation of biometric samples at any stage of processing
2681 [ISO 2382-37].

2682 Biometric Data Record

2683 Electronic data record containing biometric data. This information can be in terms of
2684 raw or compressed pixels or in terms of some *biometric characteristic* (e.g., patterns)
2685 [ISO 2382-37].

2686 **Biometric On-Card Comparison (OCC)**

2687 A one-to-one *comparison* of fingerprint *biometric data records* transmitted to the *PIV*
2688 *Card* with a biometric reference previously stored on the *PIV Card*. In this Standard,
2689 OCC is used as a means of performing card activation and as part of OCC-AUTH.

2690 **Biometric Verification**

2691 Process of confirming a biometric claim through biometric *comparison*.

2692 **Biometric Verification Decision**

2693 A determination of whether biometric probe(s) and biometric reference(s) have the
2694 same biometric source based on *comparison* score(s) during a *biometric verification*
2695 transaction [ISO 2382-37].

2696 **Capture**

2697 Series of actions undertaken to obtain and record, in a retrievable form, signals of
2698 *biometric characteristics* directly from individuals [ISO 2382-37].

2699 **Cardholder**

2700 An individual who possesses an issued *PIV Card*.

2701 **Card Management System**

2702 The card management system manages the lifecycle of a *PIV Card* application.

2703 **Central Verification System**

2704 A system operated by the Office of Personnel Management that contains information
2705 on security clearances, investigations, suitability, fitness determinations, [HSPD-12]
2706 decisions, PIV credentials, and polygraph data.

2707 **Certificate Revocation List**

2708 A list of revoked *public key* certificates created and digitally signed by a *certification*
2709 *authority* [RFC 5280] [RFC 6818].

2710 **Certification**

2711 The process of verifying the correctness of a statement or claim and issuing a
2712 certificate as to its correctness.

2713 **Certification Authority**

2714 A trusted entity that issues and revokes *public key* certificates.

2715 **Chain of trust**

2716 An interoperable data format for *PIV enrollment records* that facilitates the import and
2717 export of records between *PIV Card issuers*.

2718 Card Verifiable Certificate

2719 A certificate stored on the *PIV card* that includes a public key, the signature of a
2720 *certification authority*, and further information needed to verify the certificate.

2721 Comparison

2722 Estimation, calculation, or measurement of similarity or dissimilarity between
2723 biometric probe(s) and biometric reference(s) [ISO 2382-37]. See also *Identification*.

2724 Component

2725 An element of a large system—such as an *identity card*, *issuer*, card reader, or *identity*
2726 *verification* support—within the PIV system.

2727 Conformance Testing

2728 A process established by NIST within its responsibilities of developing, promulgating,
2729 and supporting FIPS for testing specific characteristics of *components*, products,
2730 services, people, and organizations for compliance with a FIPS.

2731 Credential

2732 Evidence attesting to one's right to credit or authority. In this Standard, it is the *PIV*
2733 *Card* or *derived PIV credential* associated with an individual that authoritatively binds
2734 an *identity* (and, optionally, additional attributes) to that individual.

2735 Cryptographic Key (Key)

2736 A parameter used in conjunction with a cryptographic algorithm that determines the
2737 specific operation of that algorithm.

2738 Derived PIV Credential

2739 A *credential* issued based on proof of possession and control of a *PIV Card*. Derived
2740 PIV credentials are typically used in situations that do not easily accommodate a *PIV*
2741 *Card*, such as in conjunction with mobile devices.

2742 Enrollment

2743 See *Identity Registration*.

2744 Enrollment Data Set

2745 A record that includes information about a biometric enrollment (i.e., name and role
2746 of the acquiring agent, office and organization, time, place, and acquisition method).

2747 Federal Agency Smart Credential Number (FASC-N)

2748 One of the primary *identifiers* on the *PIV Card* for physical *access control*, as required
2749 by FIPS 201. The FASC-N is a fixed length (25 byte) data object that is specified in
2750 [SP 800-73], and included in several data objects on a *PIV Card*.

2751 **Federal Information Processing Standards (FIPS)**

2752 A standard for adoption and use by federal departments and agencies that has been
2753 developed within the Information Technology Laboratory and published by NIST, a
2754 part of the U.S. Department of Commerce. A FIPS covers some topic in information
2755 technology to achieve a common level of quality or some level of interoperability.

2756 **Federation**

2757 A process that allows for the conveyance of *identity* and *authentication* information
2758 across a set of networked systems.

2759 **Federation Assurance Level (FAL)**

2760 A category that describes the *federation* protocol used to communicate an *assertion*
2761 containing *authentication* and attribute information (if applicable) to an RP, as defined
2762 in [SP 800-63] in terms of three levels:

2763 **FAL1**

2764 SOME confidence

2765 **FAL2**

2766 HIGH confidence

2767 **FAL3**

2768 VERY HIGH confidence

2769 **Hash Function**

2770 A function that maps a bit string of arbitrary length to a fixed length bit string. Secure
2771 hash functions [FIPS 180] satisfy the following properties:

2772 **One-Way**

2773 It is computationally infeasible to find any input that maps to any pre-specified
2774 output.

2775 **Collision Resistant**

2776 It is computationally infeasible to find any two distinct inputs that map to the same
2777 output.

2778 **Identification**

2779 The process of discovering the *identity* (i.e., origin or initial history) of a person or
2780 item from the entire collection of similar persons or items.

2781 **Identifier**

2782 Unique data used to represent a person's *identity* and associated attributes. A name or
2783 a card number are examples of identifiers.

2784 Identity

2785 The set of physical and behavioral characteristics by which an individual is uniquely
2786 recognizable.

2787 Identity Assurance Level (IAL)

2788 A category that conveys the degree of confidence that the end user's claimed *identity*
2789 is their real *identity*, as defined in [SP 800-63] in terms of three levels:

2790 IAL1

2791 SOME confidence

2792 IAL2

2793 HIGH confidence

2794 IAL3

2795 VERY HIGH confidence

2796 Identity Proofing

2797 The process of providing sufficient information (e.g., *identity* history, *credentials*,
2798 documents) to establish an *identity*.

2799 Identity Management System (IDMS)

2800 One or more systems or *applications* that manage the *identity proofing*, *registration*,
2801 and issuance processes.

2802 Identity Registration

2803 The process of making a person's *identity* known to the PIV system, associating a
2804 unique *identifier* with that *identity*, and collecting and recording the person's relevant
2805 attributes into the system. In some other NIST documents, such as [SP 800-63A],
2806 identity registration is referred to as *enrollment*.

2807 Identity Verification

2808 The process of confirming or denying that a claimed *identity* is correct by comparing
2809 the *credentials* of a person requesting access with those previously proven and
2810 associated with the *PIV Card* or a *derived PIV credential* associated with the *identity*
2811 being claimed.

2812 Issuer

2813 The organization that is issuing the *PIV Card* to an *applicant*. Typically this is an
2814 organization for which the *applicant* is working.

2815 Issuing Facility

2816 A physical site or location—including all equipment, staff, and documentation—that
2817 is responsible for carrying out one or more of the following PIV functions:

- 2818 • *identity proofing and registration*;
- 2819 • card and token production;
- 2820 • activation and issuance;
- 2821 • post-issuance binding of *derived PIV credential*; and
- 2822 • maintenance.

2823 Key

2824 See *Cryptographic Key*.

2825 Match

2826 *Comparison* decision stating that the biometric probe(s) and the biometric reference
2827 are from the same source. Match is a possible result of a *Comparison*. The opposite
2828 of a match is a non-match [ISO 2382-37].

2829 Model

2830 A detailed description or scaled representation of one *component* of a larger system
2831 that can be created, operated, and analyzed to predict actual operational characteristics
2832 of the final produced *component*.

2833 Off-Card

2834 Refers to data that is not stored within the *PIV Card* or to a computation that is not
2835 performed by the integrated circuit chip (ICC) of the *PIV Card*.

2836 On-Card

2837 Refers to data that is stored within the *PIV Card* or to a computation that is performed
2838 by the integrated circuit chip (ICC) of the *PIV Card*.

2839 Online Certificate Status Protocol (OCSP)

2840 An online protocol used to determine the status of a *public key* certificate [RFC 6960].

2841 Path Validation

2842 The process of verifying the binding between the subject *identifier* and subject *public*
2843 *key* in a certificate, based on the *public key* of a trust anchor, through the validation of
2844 a chain of certificates that begins with a certificate issued by the trust anchor and ends
2845 with the target certificate. Successful path validation provides strong evidence that the
2846 information in the target certificate is trustworthy.

2847 Personally Identifiable Information (PII)

2848 Information that can be used to distinguish or trace an individual's *identity*—such
2849 as name, social security number, *biometric data records*—alone, or when combined
2850 with other personal or identifying information that is linked or linkable to a specific
2851 individual (e.g., date and place of birth, mother's maiden name, etc.) [M-17-12].

2852 Personal Identification Number (PIN)

2853 A numeric secret that a *cardholder* memorizes and uses as part of authenticating their
2854 *identity*.

2855 Personal Identity Verification (PIV) Account

2856 The logical record containing credentialing information for a given PIV *cardholder*.
2857 This is stored within the *issuer's identity management system* and includes PIV
2858 enrollment data, *cardholder identity* attributes, and information regarding the
2859 *cardholder's PIV Card* and any *derived PIV credentials* bound to the account.

2860 Personal Identity Verification (PIV) Card

2861 A physical artifact (e.g., *identity card*, “smart” card) issued to an individual that
2862 contains a PIV Card application which stores *identity credentials* (e.g., photograph,
2863 *cryptographic keys*, digitized fingerprint representation) so that the claimed *identity* of
2864 the *cardholder* can be verified against the stored *credentials*.

2865 PIV Enrollment Record

2866 A sequence of related *enrollment data sets* that is created and maintained by *PIV Card*
2867 *issuers*. The PIV enrollment record typically contains data collected at each step of
2868 the PIV *identity proofing*, *registration*, and issuance processes.

2869 Private Key

2870 The secret part of an *asymmetric key* pair that is typically used to digitally sign or
2871 decrypt data.

2872 Pseudonym

2873 A name assigned through a formal process by a federal department or agency to a
2874 federal employee for the purpose of the employee's protection (i.e., the employee
2875 might be placed at risk if their actual name were known) or for other purposes.

2876 Public Key

2877 The public part of an *asymmetric key* pair that is typically used to verify signatures or
2878 encrypt data.

2879 Public Key Infrastructure (PKI)

2880 A support service to the PIV system that provides the *cryptographic keys* needed to
2881 perform digital signature-based *identity verification* and to protect communications
2882 and the storage of sensitive verification system data within *identity* cards and the
2883 verification system.

2884 PKI-Card Authentication (PKI-CAK)

2885 A PIV *authentication* mechanism that is implemented by an *asymmetric key*
2886 challenge/response protocol using the card *authentication key* of the *PIV Card* and
2887 a contact or contactless reader.

2888 PKI-PIV Authentication (PKI-AUTH)

2889 A PIV *authentication* mechanism that is implemented by an *asymmetric key*
2890 challenge/response protocol using the PIV *authentication key* of the *PIV Card* and
2891 a contact reader or a contactless card reader that supports the virtual contact interface.

2892 Recommendation

2893 A special publication of the ITL that stipulates specific characteristics of the
2894 technology to use or the procedures to follow to achieve a common level of quality
2895 or level of interoperability.

2896 Registration

2897 See *Identity Registration*.

2898 Symmetric Key

2899 A *cryptographic key* that is used to perform both the cryptographic operation and its
2900 inverse (e.g., to encrypt, decrypt, or create a message *authentication* code and verify
2901 it).

2902 Security Executive Agent

2903 Individual responsible for the development, implementation, and oversight of
2904 effective, efficient, and uniform policies and procedures that govern the conduct of
2905 investigations and adjudications for eligibility to access classified information and
2906 eligibility to hold a sensitive position in the Federal Government. In accordance
2907 with Executive Order 13467 (as amended), this individual is the Director of National
2908 Intelligence (DNI).

2909 Suitability and Credentialing Executive Agent

2910 Individual responsible for prescribing suitability standards and minimum standards of
2911 fitness for employment. With the issuance of Executive Order 13467, as amended, the
2912 Suitability and Credentialing Executive Agent is responsible for the development,
2913 implementation, and oversight of effective, efficient, and uniform policies and
2914 procedures governing the conduct of investigations and adjudications for Suitability,
2915 Fitness, and Credentialing determinations in the Federal Government. Pursuant to
2916 sections 1103 and 1104 of title 5, United States Code, and the Civil Service Rules,
2917 the director of the Office of Personnel Management (OPM) is the Suitability and
2918 Credentialing Executive Agent.

2919 C.2 Acronyms and Abbreviations

2920 The following acronyms and abbreviations are used throughout this Standard:

2921 AAL

2922 Authenticator Assurance Level

2923 AAMVA

2924 American Association of Motor Vehicle Association

2925 ACL

2926 Access Control List

2927 AES

2928 Advanced Encryption Standard

2929 AID

2930 Application Identifier

2931 AIM

2932 Association for Automatic Identification and Mobility

2933 ANSI

3105 **C.3 Notations**

3106 This Standard uses the following typographical conventions in text:

- 3107 • ASN.1 data types are represented in a monospaced font. For example,
3108 SignedData and SignerInfo are data types defined for digital signatures.
- 3109 • Specific terms in CAPITALS represent normative requirements. When these same
3110 terms are not in CAPITALS, the term does not represent a normative requirement.
 - 3111 – The terms “SHALL” and “SHALL NOT” indicate requirements to be
3112 followed strictly in order to conform to the publication and from which no
3113 deviation is permitted.
 - 3114 – The terms “SHOULD” and “SHOULD NOT” indicate that among several
3115 possibilities, one is recommended as particularly suitable without mentioning
3116 or excluding others, that a certain course of action is preferred but not
3117 necessarily required, or that (in the negative form) a certain possibility or
3118 course of action is discouraged but not prohibited.
 - 3119 – The terms “MAY” and “NEED NOT” indicate a course of action permissible
3120 within the limits of the publication.
 - 3121 – The terms “CAN” and “CANNOT” indicate a possibility and capability—
3122 whether material, physical, or causal—or, in the negative, the absence of that
3123 possibility or capability.

Appendix E. Revision History

3423 *This appendix is informative.* It provides an overview of the changes to FIPS 201 since its
3424 initial release.

Version	Release Date	Updates	Location
FIPS 201	February 2005	Initial Release	
FIPS 201-1	March 2006	Added the requirement for electronically distinguishable from identity credentials issued to individuals who have a completed investigation (NACI Indicator).	
FIPS 201-1 Change Notice 1	March 2006	Added clarification for variable placement of Agency Card Serial Number along the outer edge of the back of the PIV Card is allowed.	
		Also, updated ASN.1 encoding for NACI Indicator (background investigation indicator).	
FIPS 201-2	August 2013	This version represents the 5-year review of FIPS 201 and change request inputs received from agencies. Following are the highlights of changes made in this version.	
		Modified the requirement for accreditation of PIV Card issuer to include an independent review.	
		Incorporated references to credentialing guidance and requirements issued by OPM and OMB.	
		Made the facial image data element on the PIV Card mandatory.	
		Added the option to collect and store iris biometric data on the PIV Card.	
		Added option to use electronic facial image for authentication in operator-attended environments.	
		Incorporated the content from Form I-9 that is relevant to FIPS 201.	
		Introduced the concept of a “chain-of-trust” optionally maintained by a PIV Card issuer.	
		Changed the maximum life of PIV Card from 5 years to 6 years.	

		Added requirements for issuing a PIV Card to an individual under a pseudonymous identity.	
		Added requirements for issuing a PIV Card to an individual within grace period.	
		Added requirements for post-issuance updates.	
		Added option to allow for remote PIN resets.	
		Introduced the ability to issue derived PIV credentials.	
		The employee affiliation color-coding and the large expiration date in the upper right-hand corner of the card are now mandatory.	
		Made all four asymmetric keys and certificates mandatory.	
		Introduced the concept of a virtual contact interface over which all functionality of the PIV Card is accessible.	
		Added a mandatory UUID as a unique identifier for the PIV Card in addition to the FASC-N.	
		Added optional on-card biometric comparison as a means of performing card activation and as a PIV authentication mechanism.	
		Removed direct requirement to distribute certificates and CRLs via LDAP.	
		Updated authentication mechanisms to enable variations in implementations.	
		Require signature verification and certification path validation in the CHUID, BIO, and BIO-A authentication mechanisms.	
		The VIS and CHUID authentication mechanisms have been downgraded to indicate that they provide LITTLE or NO assurance in the identity of the cardholder.	

		Deprecated the use of the CHUID authentication mechanism. The CHUID data element has not been deprecated and continues to be mandatory.	
FIPS 201-3	November 2020	This version represents the 5-year review of FIPS 201 and change request inputs received from agencies. Following are the highlights of changes made in this version.	
		Alignment with SP 800-63-3 language and terms.	
		Used explicit normative language terms SHALL/SHOULD/MAY/CAN.	
		Updated process for binding and termination of derived PIV credentials with PIV account.	§2
		Updated credentialing requirements for issuance of PIV Cards based on OPM guidance.	§2
		Added requirements for supervised remote identity proofing and PIV Card maintenance.	§2
		Modified identity proofing requirements to reflect updated list of accepted documents.	§2
		Deprecated PIV NACI indicator (background investigation indicator).	§2
		Updated guidance on collection of biometric data for credentialing.	§2
		Clarified multi-session proofing and enrollment.	§2
		Provided clarification on grace periods.	§2
		Clarified biometric modalities for proofing and authentication.	§2, §6
		Updated system description and associated diagrams.	§3
		Generalized chain of trust records to enrollment records and made them required.	§3
		Deprecated the use of magnetic stripes on PIV Card.	§4
		Deprecated the use of bar codes on PIV Card.	§4

		Updated example PIV Card diagrams.	§4
		Linked expiration of content signing certificate with card authentication certificate.	§4
		Revised PIN requirements based on SP 800-63B guidelines.	§4
		Deprecated symmetric card authentication key.	§4
		Removed requirement for support of Legacy PKIs.	§5
		Removed references to OMB M-04-04 that was rescinded by OMB M-19-17.	§6
		Expressed assurance levels in terms of PAL and AAL.	§6
		Removed previously deprecated CHUID authentication mechanisms. The CHUID data element has not been deprecated and continues to be mandatory.	§6
		Deprecated VIS authentication mechanism.	§6
		Deprecated SYM-CAK authentication mechanism.	§6
		Added SM-AUTH as optional authentication mechanism.	§6
		Added section discussing federation in relationship to PIV credentials.	§7
