40 Certain commercial equipment, instruments, software, or materials, commercial or non-commercial, are identified in  
41 this paper in order to specify the experimental procedure adequately. Such identification does not imply  
42 recommendation or endorsement of any product or service by NIST, nor does it imply that the materials or  
43 equipment identified are necessarily the best available for the purpose.

44 There may be references in this publication to other publications currently under development by NIST in  
45 accordance with its assigned statutory responsibilities. The information in this publication, including concepts and  
46 methodologies, may be used by federal agencies even before the completion of such companion publications. Thus,  
47 until each publication is completed, current requirements, guidelines, and procedures, where they exist, remain  
48 operative. For planning and transition purposes, federal agencies may wish to closely follow the development of  
49 these new publications by NIST.

50 Organizations are encouraged to review all draft publications during public comment periods and provide feedback  
51 to NIST. Many NIST cybersecurity publications, other than the ones noted above, are available at  
52 <https://csrc.nist.gov/publications>.

73 **Abstract**

74 This document is the Cybersecurity Framework Profile (Profile) developed for the Electric  
75 Vehicle Extreme Fast Charging (EV/XFC) ecosystem and the subsidiary functions that support  
76 each of the four domains: (i) Electric Vehicles (EV); (ii) Extreme Fast Charging (XFC); (iii)  
77 XFC Cloud or Third-Party Operations; (iv) and Utility and Building Networks. This Profile  
78 provides a foundational profile that relevant parties may use to develop profiles specific to their  
79 organization to assess their cybersecurity posture as a part of their risk management process. The  
80 profile is intended to supplement, not replace, an existing risk management program or the  
81 current cybersecurity standards, regulations, and industry guidelines that are in current use by the  
82 EV/XFC industry.

83 **Keywords**

84 Cybersecurity Framework; electric vehicle, EV/XFC ecosystem; extreme fast charging;  
85 Framework; Mission Objectives; Profile; risk management; security controls.

86 **Reports on Computer Systems Technology**

87 The Information Technology Laboratory (ITL) at the National Institute of Standards and  
88 Technology (NIST) promotes the U.S. economy and public welfare by providing technical  
89 leadership for the Nation's measurement and standards infrastructure. ITL develops tests, test  
90 methods, reference data, proof of concept implementations, and technical analyses to advance  
91 the development and productive use of information technology. ITL's responsibilities include the  
92 development of management, administrative, technical, and physical standards and guidelines for  
93 the cost-effective security and privacy of other than national security-related information in  
94 federal information systems.

95 **Acknowledgements**

96 A complete list of contributors and acknowledgements will be released with the final version of  
97 this document.

## 98 **Call for Patent Claims**

99 This public review includes a call for information on essential patent claims (claims whose use  
100 would be required for compliance with the guidance or requirements in this Information  
101 Technology Laboratory (ITL) draft publication). Such guidance and/or requirements may be  
102 directly stated in this ITL Publication or by reference to another publication. This call also  
103 includes disclosure, where known, of the existence of pending U.S. or foreign patent applications  
104 relating to this ITL draft publication and of any relevant unexpired U.S. or foreign patents.

105 ITL may require from the patent holder, or a party authorized to make assurances on its behalf,  
106 in written or electronic form, either:

107 a) assurance in the form of a general disclaimer to the effect that such party does not hold  
108 and does not currently intend holding any essential patent claim(s); or

109 b) assurance that a license to such essential patent claim(s) will be made available to  
110 applicants desiring to utilize the license for the purpose of complying with the guidance  
111 or requirements in this ITL draft publication either:

112 i. under reasonable terms and conditions that are demonstrably free of any unfair  
113 discrimination; or

114 ii. without compensation and under reasonable terms and conditions that are  
115 demonstrably free of any unfair discrimination.

116 Such assurance shall indicate that the patent holder (or third party authorized to make assurances  
117 on its behalf) will include in any documents transferring ownership of patents subject to the  
118 assurance, provisions sufficient to ensure that the commitments in the assurance are binding on  
119 the transferee, and that the transferee will similarly include appropriate provisions in the event of  
120 future transfers with the goal of binding each successor-in-interest.

121 The assurance shall also indicate that it is intended to be binding on successors-in-interest  
122 regardless of whether such provisions are included in the relevant transfer documents.

123 Such statements should be addressed to: [evxfc-nccoe@nist.gov](mailto:evxfc-nccoe@nist.gov)

## 198 **1. Introduction**

199 To address risks to critical infrastructure, the Cybersecurity Enhancement Act of 2014 [\[S.1353\]](#)  
200 assigned responsibility to the National Institute of Standards and Technology (NIST) to identify  
201 and develop cybersecurity risk frameworks for voluntary use by critical infrastructure owners  
202 and operators. This formalized NIST’s previous work developing Version 1.0 of the Framework  
203 under Executive Order (EO) 13636, *Improving Critical Infrastructure Cybersecurity*, and  
204 provided guidance for future Framework evolution [\[EO.13636\]](#). The NIST Cybersecurity  
205 Framework [\[NIST-CSF\]](#) is a voluntary, risk-based assemblage of industry standards and best  
206 practices designed to help organizations manage cybersecurity risks. Standards listed in the  
207 informative reference section are simply recognized best practices or provide relevant  
208 information and are not meant to represent any type of regulatory or compliance mandate from  
209 this document. Informative references listed under “Ecosystem” can provide additional  
210 information or best practices for any ecosystem member, references listed under specific  
211 domains (EV, XFC/EVSE, Cloud/Third Party, Utility/Building Management Systems) can  
212 provide information or best practices for that domain.

213 Currently, there are approximately 2M electric vehicles (EV) in operation, and the number of EV  
214 is projected to be 24.6M by 2030 [\[EEI-2022\]](#). The EV infrastructure was prominently integrated  
215 into the Infrastructure Investment and Jobs Act and is also expected to grow. As of 2023, there  
216 were over 48,000 public charging stations in the US, and a commitment by the Infrastructure  
217 Investment and Jobs Act is in place to increase this number to 500,000 by 2030. The U.S. EV  
218 charging infrastructure market size was valued at \$3.15B in 2022 and is expected to grow to  
219 \$24B by 2030. [\[Grandview\]](#)

220 Given the current value, expected growth, potential for cyber related attacks, and the criticality  
221 of the transportation and energy sectors, the Department of Energy (DOE) in collaboration with  
222 the Electric Power Research Institute (EPRI) studied the Electric Vehicle/Extreme Fast Charging  
223 ecosystem (EV/XFC ecosystem). Recognizing the need for relevant parties to assess their  
224 cybersecurity posture as a part of risk management, the DOE commissioned NIST to apply the  
225 CSF to the EV/XFC ecosystem.

226 This document is the result of that effort. The Cybersecurity Framework Profile for Extreme Fast  
227 Charging (XFC) Infrastructure (referred to herein as the EV/XFC Cybersecurity Profile) is a  
228 sector level profile. The EV/XFC Cybersecurity Profile is an application of the Framework  
229 Categories and Subcategories in the context of the EV/XFC cybersecurity ecosystem as provided  
230 by the DOE and EPRI. The EV/XFC Cybersecurity Profile provides ecosystem-relevant parties a  
231 means to assess and communicate their cybersecurity posture in a manner consistent with the  
232 Cybersecurity Framework. The EV/XFC Cybersecurity Profile provides users with an industry  
233 level risk-based approach for managing cybersecurity activities and facilitates cross-  
234 collaboration between the various industry relevant parties, vendors, and end users.

235 **Fig. 1.** Charging an EV.

## 236 **1.1. Purpose**

237 The EV/XFC Cybersecurity Profile is designed to be part of an enterprise risk management  
238 program to aid organizations in managing threats to systems, networks, and assets within the  
239 EV/XFC ecosystem. The EV/XFC Cybersecurity Profile is not intended to serve as a solution or  
240 compliance checklist. Users of this profile will understand that its application cannot eliminate  
241 the likelihood of disruption or guarantee some level of assurance.

242 Use of the Profile will help organizations:

- 243 • Identify key assets and interfaces in each of the ecosystem domains.
- 244 • Address cybersecurity risk in the management and use of EV/XFC services.
- 245 • Identify the threats, vulnerabilities, and associated risks to EV/XFC services, equipment,  
246 and data.
- 247 • Apply protection mechanisms to reduce risk to manageable levels.
- 248 • Detect disruptions and manipulation of EV/XFC services.
- 249 • Respond to and recover from EV/XFC service anomalies in a timely, effective, and  
250 resilient manner.

## 251 **1.2. Scope**

252 The EV/XFC ecosystem relies on multiple connected domains. This profile addresses the four  
253 major domains in the EV/XFC ecosystem:

- 254 • **EV.** EVs come in a variety of shapes and sizes—motorcycles, cars, Electric Vehicle  
255 Take-Off and Landing (EVTOL) equipment, such as drones or aircraft, and commercial  
256 vehicles (e.g., tractor-trailers, construction vehicles, buses). EVs rely on multiple  
257 networking systems to communicate internally and with external entities. Internally there  
258 are control systems for batteries, motors, charging, and the vehicle itself that operates  
259 through an internal Control Area Network (CAN). The charger and vehicle communicate

- 260 through a physical connector. The vehicle communicates with vendor cloud/third-party  
261 organizations via Bluetooth, wi-fi, or cellular.
- 262 • **XFC/EVSE.** Electric Vehicle Supply Equipment (EVSE) are systems that provide  
263 electric power to the vehicle to recharge the vehicle’s batteries. EVSE systems include  
264 electrical conductors, related equipment such as Battery Energy Storage Systems (BESS),  
265 software, and communications protocols that deliver energy efficiently and safely to the  
266 vehicle. Extreme Fast Charging (XFC) is a type of EVSE that is capable of recharging  
267 vehicles in a manner of minutes rather than hours. [\[Energies-2019\]](#) In addition to  
268 connecting to the EV, the XFC/EVSE and related equipment must connect and  
269 communicate with cloud providers and third-party vendors for providing EVSE location  
270 information, billing, and other services.
  - 271 • **Cloud/Third-Party Organizations.** The EV/XFC ecosystem consists of independently  
272 owned and operated domains, and most charging stations are operated by a charging  
273 network with business models that blend station, electricity, and vehicle charging sales  
274 together. Third parties are individuals or entities that facilitate transactions but are not  
275 one of the primary parties within the exchange. The EV/XFC ecosystem typically uses  
276 cloud service providers for these transactions because they are suitable for sensitive data  
277 exchanges that involve financial information, personally identifiable information, and  
278 other potentially sensitive data.
  - 279 • **Utilities/Building Systems.** Utilities provide the power necessary to fuel the EV/XFC  
280 ecosystem. Building and facility management systems may be present in installations  
281 where energy management is required, such as EVSE installed at shopping centers, as  
282 well as where distributed energy resources (DER) may be present or where physical  
283 security control is required. Both utilities and building/facility management systems  
284 include equipment to monitor power utilization, communicate with networked devices  
285 and supervisory systems, and help control on-site energy demands.
- 286 The scope of cybersecurity and enterprise risk management includes operational technology  
287 (OT) in addition to information technology (IT). While managing cybersecurity risks is equally  
288 important to IT and OT processes, there are considerable operational differences between the  
289 two, which may impact the implementation of risk management techniques for IT vs OT.  
290 Despite these differences, the interdependencies between IT and OT are increasing which leads  
291 to increasing reliance of OT on IT processes and possibly inherited vulnerabilities and risks  
292 between the two technologies.
- 293 The EV/XFC ecosystem has always relied on a combination of IT and OT processes. Integrated  
294 risk management includes a collaboration of IT and OT professionals to generate integrated  
295 assessments, mitigations, and recovery plans.
- 296 The foundational concepts used to define the EV/XFC Cybersecurity Profile’s scope were  
297 derived from previous research and documentation developed by the Electric Power Research  
298 Institute (EPRI) [\[EPRI-2023\]](#) as illustrated in Fig. 2 below. Power generation and  
299 communications within the utility is outside the scope of the EV/XFC Cybersecurity Profile.

300 **Fig. 2. EV/XFC Ecosystem Domains and Profile Scope.**

301 **1.3. Audience**

302 The EV/XFC Cybersecurity Profile may be used by any number of relevant parties within the  
303 EV/XFC ecosystem. The relevant parties within the ecosystem are diverse and growing.  
304 Members of the ecosystem include:

- 305 • EV owners (including individuals in the general public and fleet owners)
- 306 • EV manufacturers
- 307 • EVSE owners/operators
- 308 • EVSE manufacturers
- 309 • Cloud/third-party providers
- 310 • Utility owner/operators
- 311 • Building Network Owners/Providers
- 312 • Suppliers/Vendors

313 This document is intended for organizations and relevant parties involved in the EV/XFC  
314 industry that use or produce EV/XFC services, systems, and related components such as:

- 315 • Public and private organizations that use or provide EV/XFC services
- 316 • Managers responsible for the use or provision of EV/XFC services
- 317 • Risk managers, cybersecurity professionals, and others with a role in risk management  
318 for systems that use or provide EV/XFC services
- 319 • Procurement officials responsible for the acquisition of EV/XFC infrastructure or  
320 services
- 321 • Mission and business process owners responsible for achieving operational outcomes  
322 dependent on EV/XFC services

323 The EV/XFC Cybersecurity Profile is intended for a general audience and is broadly applicable.  
324 The Profile applies to organizations that:

- 325 • Have already adopted the NIST Cybersecurity Framework to help identify, assess, and  
326 manage cybersecurity risks.
- 327 • Are familiar with the Framework and want to improve their risk postures.
- 328 • Are unfamiliar with the Framework but need to implement risk management frameworks  
329 for their organization.

## 330 **2. Intended Use**

331 The EV/XFC Cybersecurity Profile provides a framework that organizations may use to assess  
332 their cybersecurity posture (both the “as is” and “to be” states) as a part of their risk management  
333 processes and procedures. This profile provides guidance, and its use is voluntary. The Profile  
334 provides an assessment methodology for organizations to determine risks and the potential  
335 impacts of cyber based disruptions to the EV/XFC ecosystem. The Profile is intended to help  
336 organizations within the EV/XFC community prioritize cybersecurity activities based on their  
337 mission and/or business objectives.

338 Additionally, the Profile can be used to help organizations identify areas where standards,  
339 practices, and other guidance can help manage risks to systems that use EV/XFC services. An  
340 organization can use the Profile in conjunction with its processes for identifying, assessing, and  
341 managing risk. The Profile is intended to complement, not replace, the organization’s existing  
342 risk management processes. This Profile is intended to be used as a foundational profile, and  
343 specific organizations can customize the EV/XFC Cybersecurity Profile by considering the  
344 following questions:

- 345 • What are the mission objectives for the organizations within the ecosystem?
- 346 • What processes or assets support the mission objective?
- 347 • What processes and assets are vulnerable to disruption or degradation?
- 348 • What is the impact to the mission should a process or asset be lost or degraded?
- 349 • What are the integrity and availability thresholds of EV/XFC to avoid mission impact?
- 350 • What safeguards are available?
- 351 • What techniques can be used to detect events of concern?
- 352 • What techniques can be used to respond to events of concern?
- 353 • What techniques can be used to recover pre-event capabilities?

## 354 **3. EV/XFC Cybersecurity Mission Objectives**

355 The EV/XFC Cybersecurity Mission Objectives (MOs) provide the context for an organization to  
356 manage its cybersecurity risk as it relates to its specific mission needs. The following MOs can  
357 serve as a starting point for a particular organization to define their own cybersecurity MOs.

358 **3.1. Mission Objective 1: Deliver Reliable Performance through Secure**  
359 **Communications**

360 Communicating across the XFC infrastructure is critical to the performance in the EV/XFC  
361 ecosystem and the success of the EV industry. Because of this in tandem dependency, the  
362 communications should be reliable and secure to fulfill the ecosystem’s mission needs. The XFC  
363 infrastructure faces many operational and cybersecurity threats and vulnerabilities, especially to  
364 its communication infrastructure; therefore, greater attention is needed to secure  
365 communications. Secure communications enable fundamental EV/XFC activities, such as  
366 charging experience, billing processes, and availability of charging stations.

367 The rationale for this Mission Objective includes:

- 368 • **EV.** Communication between the EV (battery management system) and the charging  
369 station is necessary to facilitate the EV battery charging process. The EV connects to  
370 cloud/third-party applications to manage the transactions and collect data. EV user  
371 systems (e.g., infotainment) also may communicate with other vehicle systems, such as  
372 the charge controller and battery management systems. The interface between these  
373 applications presents a potential attack surface for malicious actors to cause damage.
- 374 • **XFC/EVSE.** The charging station requires secure communication to the cloud to  
375 facilitate financial transactions, provide authorization to charge, collect maintenance logs,  
376 and receive updates. Additionally, the charging station draws power from the metered  
377 utility.
- 378 • **Cloud/Third-Party.** Cloud service providers require reliable secure connections to the  
379 EV, charging station, and the utility to facilitate the charging process. Secure reliable  
380 communications allow for validation of financial transactions, protect personal  
381 information, and allow for maintenance updates and logs to be transmitted quickly and  
382 economically.
- 383 • **Utility/Building Management Systems.** Utilities provide power to the charging station.  
384 Coordination between the XFC chargers and utilities are required for various smart grid  
385 applications such as peak shaving/load shifting or forecasting. Where this communication  
386 exists, it must be reliable and secure.

387 **3.2. Mission Objective 2: Maintain Resilience of the XFC Infrastructure**

388 All users in the EV/XFC ecosystem should have reliable access to services. A loss of  
389 cybersecurity may impact physical security; therefore, organizations must implement safeguards  
390 to ensure the resilience of the EV/XFC ecosystem. All cybersecurity decisions should be  
391 balanced with business needs to maintain usability of the system while keeping the ecosystem  
392 secure and resilient.

393 The rationale for this Mission Objective includes:

- 394 • **EV.** EV owners want assurance that their vehicle is protected before they are willing to  
395 participate in the charging ecosystem. Batteries are a significant expense, and a  
396 compromised XFC ecosystem could potentially lead to physical damage to the battery,

397 EV components, and other nearby equipment. Thus, implemented safeguards will ease  
398 the minds of users and encourage them to use the charging stations.

399 • **XFC/EVSE.** Due to the unique position of charging stations in the ecosystem, its  
400 geographical dispersion, and its general lack of physical security, charging stations have  
401 become an appealing target for threat actors. EVSE infrastructures should be protected,  
402 both cyber and physical, to prevent attacks like ransomware or damage to the charging  
403 infrastructure itself.

404 • **Cloud/Third-Party.** The cloud/third-party environment facilitates connectivity between  
405 domains of the infrastructure. It should be protected to maintain operations.

406 • **Utility/Building Management Systems.** Utilities should have protection systems in  
407 place to prevent manipulation of utility components to maintain safe operations.

### 408 **3.3. Mission Objective 3: Build and Maintain Trustworthy Relationships with** 409 **Partners and Customers**

410 EV/XFC cybersecurity requires collection and use of partner and customer data from many  
411 sources. Building and maintaining relationships with relevant parties demands organizations  
412 consider and mitigate against risks throughout the information lifecycle. Protecting the  
413 confidentiality of sensitive information (e.g., system status information) ensures confidence in  
414 the organization and establishes trust among partners and with customers. Personal information  
415 should also be protected (e.g., credit card information, individual XFC usage patterns) to ensure  
416 that user information is not correlated for inappropriate use, resulting in a loss of trust from  
417 users. Cybersecurity disruptions to systems can impact product quality, leading partners, and  
418 customers to question the trustworthiness of the organization.

419 The rationale for this mission objective includes:

420 • **EV.** EV owners trust that charging stations will be available and operable, will not be  
421 damaged while charging, and will protect their information during transactions.

422 • **XFC/EVSE.** EVSEs are the most visible representation of the EV/XFC ecosystem, and a  
423 cyber incident can have broad impact leaving the public uncertain of the safety and  
424 reliability of EVs, potentially impacting future sales.

425 • **Cloud/Third-Party.** Cloud and third-party providers capture and maintain sensitive  
426 financial information for transactions across the EV/XFC ecosystem. Inadvertent release  
427 of this sensitive information can result in a loss of trust from all ecosystem relevant  
428 parties as well as result in high costs to the cloud/third-party providers due to fines, civil  
429 lawsuits, or compensation to customers.

430 • **Utility/Building Management Systems.** Disruptions in the power supply may leave EV  
431 owners stranded and others in the EV/XFC ecosystem unable to perform their business  
432 functions. These types of disruptions erode trust in the EV/XFC ecosystem.

### 433 **3.4. Mission Objective 4: Maintain Continuity of Operations**

434 The EV/XFC ecosystem must sustain operations and ensure the organization’s mission continues  
435 in the face of adversity. Organizations need to monitor for deviations to identify potential  
436 cybersecurity events and detect and respond to anomalous behavior. Cyber supply chain risk  
437 management processes should also be identified and agreed to by organizational relevant parties.  
438 Moreover, organizations account for disruptions through business continuity/contingency  
439 planning and implementation of response and recovery plans. Achieving this objective requires  
440 each domain in the EV/XFC ecosystem to work together as expected.

441 The rationale for this mission objective includes:

- 442 • **EV.** Understanding when an EV is compromised or acting outside its normal baseline  
443 operation is key to safe and reliable operations of the vehicle.
- 444 • **XCF/EVSE.** To detect anomalous behavior, it is necessary to understand the stations’  
445 charging cycle profile and power consumption to identify deviations from normal  
446 operations, which may indicate malicious behavior. Supply chain issues (e.g., quality,  
447 integrity, availability) impact the reliability of EVSE.
- 448 • **Cloud/Third-Party.** Cloud/third-party entities must be able to identify malicious  
449 behaviors that deviate from cybersecurity baselines (e.g., unknown, or new connections  
450 and/or transmissions from sources other than the service provider or authorized by the  
451 service provider).
- 452 • **Utility/Building Management Systems.** Utilities typically have programs in place to  
453 detect anomalous activity from external systems that could impact operations.

## 454 **4. Overview of the Cybersecurity Framework**

455 This section was derived from Version 1.1 of the NIST Cybersecurity Framework (CSF), and the  
456 reader is advised to consult the CSF and its corresponding quick start guide for additional details  
457 [\[NIST-CSF\]](#) [\[NIST-SP1271\]](#). The CSF assists organizations in better managing and reducing  
458 cybersecurity risk in a way that responds to the industry’s unique cybersecurity needs, risks,  
459 threats, and/or cyber sophistication (regardless of its size). The Framework provides an approach  
460 to analyzing cybersecurity risk, enabling enterprises to understand their cybersecurity challenges,  
461 and selecting appropriate mitigation strategies. The Framework emphasizes the risk management  
462 process for cybersecurity by stating that “the Framework focuses on using business drivers to  
463 guide cybersecurity activities and considering cybersecurity risks as part of the organization’s  
464 risk management process” [\[NIST-CSF\]](#).

465 The Framework presents industry standards, guidelines, and practices in a manner that allows  
466 cybersecurity activities and outcomes to be clearly communicated at all levels of an organization,  
467 from executives to individuals with operational job roles. Building on those standards,  
468 guidelines, and practices, the Framework provides a common taxonomy and mechanism for  
469 organizations to:

- 470 • Describe their current cybersecurity posture.
- 471 • Describe their target state for cybersecurity.

472 • Identify and prioritize opportunities for improvement within the context of a continuous  
473 and repeatable process.

474 • Assess progress toward the target state.

475 • Communicate among internal and external relevant parties about cybersecurity risk.

476 The Framework consists of three main components: the Core, Profiles, and Implementation  
477 Tiers. The Core is a catalog of cybersecurity activities and their outcomes written in a common  
478 language. A Framework profile is an alignment of organizational requirements, objectives, risk  
479 appetite, and resources against the desired outcomes of the Framework Core. Implementation  
480 Tiers guide organizations to consider the appropriate level of rigor for their cybersecurity  
481 program and can be used as a communication tool to discuss risk appetite, mission priority, and  
482 budget; further discussion on Implementation Tiers is not included in this profile.

#### 483 4.1. The Framework Core

484 The Framework Core consists of five Functions [NIST-CSF]:

485 • **Identify.** The activities in the Identify Function are the foundation for effective use of the  
486 Framework. Understanding the business context, the resources that support critical  
487 functions, and the related cybersecurity risks enables an organization to focus on and  
488 prioritize its efforts, consistent with its risk management strategy and business needs.

489 • **Protect.** The Protect Function supports the ability to limit or contain the impact of a  
490 potential cybersecurity event.

491 • **Detect.** The Detect Function enables timely discovery of cybersecurity events.

492 • **Respond.** The Respond Function supports the ability to contain the impact of a potential  
493 cybersecurity event.

494 • **Recover.** The Recover Function supports timely recovery to normal operations to reduce  
495 the impact from a cybersecurity event.

496 When considered together, these functions provide a high-level, strategic view for managing  
497 cybersecurity risk. The Framework further identifies underlying key categories and subcategories  
498 for each function and matches them with example informative references such as existing  
499 standards, guidelines, and practices for each Subcategory. As stated previously, the informative  
500 references are meant to be used as examples of best practices and to provide relevant information  
501 and are by no means any type of regulatory or compliance mandate from the perspective of this  
502 guidance **Table 1** illustrates the alignment of Categories to Functions.

503

504

**Table 1.** Function and Category Unique Identifiers.

Function	Function Unique Identifier	Category	Category Unique Identifier
<b>IDENTIFY</b>	ID	Asset Management	ID.AM
		Business Environment	ID.BE
		Governance	ID.GV
		Risk Assessment	ID.RA
		Risk Management Strategy	ID.RM
		Supply Chain Risk Management	ID.SC
<b>PROTECT</b>	PR	Access Control	PR.AC
		Awareness and Training	PR.AT
		Data Security	PR.DS
		Information Protection Processes and Procedures	PR.IP
		Maintenance	PR.MA
		Protective Technology	PR.PT
<b>DETECT</b>	DE	Anomalies and Events	DE.AE
		Security Continuous Monitoring	DE.CM
		Detection Processes	DE.DP
<b>RESPOND</b>	RS	Response Planning	RS.RP
		Communications	RS.CO
		Analysis	RS.AN
		Mitigation	RS.MI
		Improvements	RS.IM
<b>RECOVER</b>	RC	Recovery Planning	RC.RP
		Improvements	RC.IM
		Communications	RC.CO

505 The Framework categories decompose into subcategories which are more detailed cybersecurity  
 506 activities and specific outcomes of technical and/or management activities. The final components  
 507 of the Framework Core are informative references. Informative references map the Subcategories  
 508 and provide the reader with existing standards, guidelines, and practices that can help an  
 509 organization achieve the desired outcome for each Subcategory.

510 Profile development applies the Cybersecurity Framework in focusing on the cybersecurity areas  
 511 of particular concern to an industry, organization, or functional area as identified through its risk  
 512 management processes. By evaluating the elements of the Cybersecurity Framework in the  
 513 context of a particular mission, organization, or sector, a profile is created that shows the  
 514 organization’s cybersecurity posture based on evaluation of the mission against the  
 515 Cybersecurity Framework Functions, Categories, and Subcategories.

516 Profiles are used to identify opportunities for improving an organization’s cybersecurity posture  
 517 by creating and comparing a “current” profile (the “as is” state) with a “target” profile (the “to

518 be” state). A target profile offers a prioritization of Subcategories based on pressing mission and  
519 operational considerations for a specific community, industry, or group of relevant parties.  
520 Target profiles are a basis for identifying and engaging in discussions about cybersecurity  
521 activities and outcomes that are important to the profile’s user community. Within an  
522 organization, profiles offer a consistent way to discuss cybersecurity objectives across  
523 organizational or agency roles—from senior leadership to technical implementors—using  
524 common terminology. Individuals within the organization or agency may use the gaps between  
525 the current and target profiles to discuss prioritization and allocation of resources to meet  
526 cybersecurity objectives.

## 527 **4.2. Sector-Level Profiles**

528 Sector-level profiles, though not formally defined in the CSF, emerged as a concept after the  
529 development of the CSF. Sector-level profiles can act as a starting point for members of the  
530 sector to develop their organization’s “current” or “target” profile. Sector-level profiles provide a  
531 basis for sub-sectors and individual organizations to facilitate conversations and discuss security  
532 activities using consistent terminology. Sector-level profiles are intended to:

- 533 • Provide a foundational profile for organizations to augment or tailor specific to their  
534 organizational needs.
- 535 • Decrease the chance that organizations overlook a Category or Subcategory.
- 536 • Encourage consistent analysis of cybersecurity-risk in the sector ecosystem/environment.
- 537 • Align sector and regulatory cybersecurity requirements or needs.

538 Developing sector level profiles can be facilitated through a collaborative, community of interest  
539 (COI) driven process. To ensure that a profile aligns cybersecurity outcomes with mission and  
540 business needs, input from relevant parties and experts in the targeted field is critical.

## 541 **5. XFC Baseline Profile**

542 The XFC Baseline Profile was created by using the Cybersecurity Framework as described in  
543 [Sec. 4](#). The baseline profile consists of tables for each Category that summarize how each  
544 associated Subcategory applies generally to the EV/XFC ecosystem with informative references  
545 for additional guidance. The tables provide domain specific considerations as appropriate.

546 By design, the Cybersecurity Framework is inherently flexible to accommodate the unique  
547 environments and needs of different organizations. Users of this document will understand that  
548 deviations between their enterprise and the assumptions made in this profile may impact the  
549 applicability of the Subcategories. *Therefore, relevant parties are advised to review all the*  
550 *Subcategories in the context of their organization.*

### 551 **5.1. Identify Function**

552 Cybersecurity decisions are not made in a vacuum but within the context of each organization’s  
553 business goals and objectives. Decision making evaluates alternatives based on their potential  
554 impact on the business.

555 The Identify Function is the foundation of the risk assessment process, so risk management  
556 practitioners should start there first. Consideration of the organization’s mission and business  
557 objectives, threat environment, assets, and vulnerabilities will have significant influence on the  
558 overall risk management decision and will also impact the other four Functions (i.e., Protect,  
559 Detect, Respond, Recover).

560 The objectives of the Identify function include:

- 561 • Identifying the business or operational environment and organization’s purpose
- 562 • Identifying all assets, including hardware, software, personnel, roles, and responsibilities,  
563 and assets’ criticality
- 564 • Identifying infrastructure that provides ground segment functionality
- 565 • Identifying the current and trending vulnerabilities, threats, and impacts should the threat  
566 be realized to assess the risk.

567 The Identify Function consists of six Categories:

- 568 • Asset Management
- 569 • Business Environment
- 570 • Governance
- 571 • Risk Assessment
- 572 • Risk Management
- 573 • Supply Chain Risk Management

574 Each of these Categories and associated Subcategories are summarized in [Sec. 5.1.1](#) through [Sec.](#)  
575 [5.1.6](#).

### 576 **5.1.1. Asset Management Category**

577 The data, personnel, devices, systems, and facilities that enable the organization to achieve  
578 business purposes are identified and managed consistently with their relative importance to  
579 organizational objectives and the organization’s risk strategy.

580 In the context of the ecosystem, managing these resources provides the information needed to  
581 inform ongoing decision making consistent with the organization’s business objectives and risk  
582 strategy. The domains within the EV/XFC ecosystem operate independently to achieve common  
583 goals. However, to best manage and use their resources, interdependencies and collaborations  
584 should be considered among the domains.

**Table 2.** Identify: Asset Management Category.

Subcategory   Domain	Applicability	Informative References
<p><b>AM-1:</b> Physical devices and systems within the organization are inventoried.</p>	<p><b>Ecosystem:</b> Hardware inventory is a basic function that supports security and management. The inventory’s ability to support security and management is dependent on its accuracy and granularity. Factors that contribute to the accuracy include how frequently inventories are performed, how thoroughly the inventory is performed (through means such as automation), and the use of physical inspections or other mechanisms for verification. Factors that contribute to the granularity of the inventory include information such as the manufacturer, model number, serial number, version, its function, or its enabled (or disabled) capabilities. The inventory should include rented or leased equipment in addition to assets that are directly owned and managed by the organization. A comprehensive inventory may define subsystems, components, or subassemblies as distinct physical assets.</p>	<p><b>NIST SP 800-53 Rev 5</b> CM-8, PM-5 <b>NERC CIP</b> 002-5.1a-R1</p>
<p><b>AM-1   EV</b></p>	<p>Not directly applicable to EV manufacturers once the vehicle is delivered to the customer; however, manufacturers may catalogue the equipment installed in their vehicles and consider providing that information to EV owners as needed.</p> <p>EV owners may consider being aware of the basic information about their vehicle, such as voltage ratings, rated charging current, charging method (AC or DC) and charging connector type.</p>	<p>[<b>NIST SP 800-53 Rev 5</b>] CM-8, PM-5</p>
<p><b>AM-1   XFC/EVSE</b></p>	<p>Applicable, no domain specific considerations.</p>	<p><b>NIST SP 800-53 Rev 5</b> CM-8, PM-5 <b>ISA 62443-2-1:D4E1</b> CM 1.1 <b>ISA 62443-3-3:2013</b> SR 7.8 <b>NIST Handbook 44</b> 1.10 G-S.1(a)-(c), G-S.2, G-S.6 <b>[OIML D31:2019]</b> 6.2.2.1.1 <b>[OIML G22:2022]</b> 4.1, 5.1</p>

Particular attention should be paid to PCI data flows and data flows to and from data lakes.</p>	<p><b>NIST SP 800-53 Rev 5</b> CA-3, CA-6, CA-9</p>
<p><b>AM-3   Utility/Building Management System</b></p>	<p>Particular attention should be paid to data lakes. Data path/flow diagrams will show relevant utility/substation SCADA system layouts including PLCs, HMIs, and the equipment they control. Diagrams should consider showing how the cloud network communicates information to the utility. The diagrams can show how information flows and the communication protocols they use.</p>	<p><b>ISA 62443-2-1:D4E1</b> NET 1.01</p> <p><b>NIST SP 800-53 Rev 5</b> CA-3, CA-6, CA-9</p>
<p><b>AM-4:</b> External information systems are catalogued.</p>	<p><b>Ecosystem:</b> Catalogue external partner connections and level of access to external information systems, establish processes and agreements with all external partners to ensure an understanding of information system usage, and establish a level of trust and security that is consistent with the policies of the organization.</p>	<p><b>NIST SP 800-53 Rev 5</b> AC-20, PM-5, SA-9</p> <p><b>NERC CIP</b> 011-2-R1</p>

Subcategory   Domain	Applicability	Informative References
AM-4   EV	Directly applicable. This should include cataloging EVSE connections to EV, processes used to verify EV identity and accounts, and charge profile information (current, capacity, battery health, etc.) communication. EV connections to cloud-based systems, including account, profile, and location information, should also be included.	NIST SP 800-53 Rev 5 AC-20, PM-5, SA-9
AM-4   XFC/EVSE	External information systems that EVSE interface with may include EV-specific systems as well as any communication to any cloud/third-party operators or utility/building management systems. EVSE functionality may be dependent upon external information systems to support EVSE connections to EV, to the utility (data flow for power metering, account billing, and demand forecasting) and connections to cloud (to support data flow for charge station search and reservation and billing information).	ISA 62443-2-1:D4E1 ORG 1.1
AM-4   Cloud/Third-Party	Cloud/third-party owners/operators may include interactions with external partners, systems, and entities, such as EVSE, utilities, building/facility management systems, and transaction management systems.	NIST SP 800-53 Rev 5 AC-20, PM-5, SA-9
AM-4   Utility/Building Management System	Some aspects of utility or building/facility management require external information systems for proper operation and support EVSE connections to utility and cloud-based systems for functions such as demand forecasting.	ISA 62443-2-1:D4E1 ORG 1.1
AM-5: Resources (e.g., hardware, devices, data, time, personnel, and software) are prioritized based on their classification, criticality, and business value.	<b>Ecosystem:</b> Identification and prioritization of the criticality and business value of assets is a pre-requisite for allocation of resources and enables risk management decisions to either reduce or accept the residual risk. Prioritization of assets allows an organization to focus on the most pending needs first. Special consideration should be given to user safety, financial, and privacy/personally identifiable information security during prioritization.	[NIST-SP800-37r2] [NIST-SP800-53r5] AC-20, CP-2, CP-8, RA-2, RA-9, SA-20, SC-6
AM-5   EV	Directly applicable. EV manufacturers have an additional concern in that they will be supporting equipment and systems already in the customer's possession and use. In addition to their current assets, manufacturers may consider the importance of resources necessary to support discontinued models.	[NIST-SP800-53r5] AC-20, RA-2, RA-9, SA-20, SC-6

Subcategory   Domain	Applicability	Informative References
<b>AM-5   XFC/EVSE</b>	<p>Directly applicable. The prioritization of resources will be influenced by the XFC/EVSE’s ability to support different makes and models of EV. The resource prioritization may be updated as the number and variety of EVs change.</p> <p>XFC/EVSE stations are geographically diverse, and the local owners/operators may have different risk tolerances. As such, the evaluations may be adjusted based on local threat assessments, vulnerabilities of local equipment, local risk assessments, and the individual owners’ tolerance. EVSE manufacturers may consider supporting equipment and systems already in the customer’s possession and use, which would influence the prioritization process. EVSE owners/operators can acknowledge that prioritization may be adjusted based on geographical location in addition to the equipment/system type and model. This may mean defining what types of EVs are eligible to charge during times of decreased availability. For example, emergency response EVs may be prioritized during an emergency to ensure that their missions are upheld.</p>	<p><b>ISA 62443-2-1:D4E1</b> DATA 1.1</p> <p><b>[OIM D31:2019]</b> 6.2.2.2.4</p>
<b>AM-5   Cloud/Third-Party</b>	<p>Directly applicable with an understanding that the criticality to customer and partners organizations should be part of the prioritization.</p>	<p><b>[NIST-SP800-53r5]</b> AC-20, RA-2, RA-9, SA-20, SC-6</p>
<b>AM-5   Utility/Building Management System</b>	<p>Applicable with the additional consideration that some of their consumers may be elements of the critical infrastructure (such as shipping or disaster recovery). This may mean prioritizing what loads receive power during a time of decreased availability and communicating that prioritization with partners.</p>	<p><b>ISA 62443-2-1:D4E1</b> DATA 1.1</p> <p><b>[NIST-SP800-53r5]</b> AC-20, RA-2, RA-9, SA-20, SC-6</p>
<b>AM-6:</b> Cybersecurity roles and responsibilities for the entire workforce and third-party stakeholders (e.g., suppliers, customers, partners) are established.	<p><b>Ecosystem:</b> Clear definition of roles and responsibilities enables the coordinator of cybersecurity programs. The roles and responsibilities for external organizations such as customers, partners, third parties, and suppliers may be defined in advance on a case-by-case basis. Consider putting memorandums of understanding or other agreements in place to facilitate tracking a participant’s performance and hold them accountable for their responsibilities. Role and responsibility definitions will include details about authorities across domains, cover the entire cybersecurity posture of an organization including accounting for external relevant parties, and detail the level of transparency required for accountable and acceptable use, storage, and interaction with intellectual property.</p>	<p><b>[NIST-SP800-53r5]</b> CP-2, PM-2, PM-11 PM-29, PS-2, PS-7</p> <p><b>NERC CIP</b> 004-6-R4, 004-6-R2</p>
<b>AM-6   EV</b>	<p>Directly applicable. Additional relevant parties for EV manufactures include elements of the workforce involved in vehicle design, and pre/post-sales support. EV owners should be made aware of methods and opportunities for good cyber hygiene as it relates to their EV usage, as well as informed on the responsibilities to the customer of their vehicle manufacturer.</p>	<p><b>[ISO 21434]</b> RQ-07-04</p>

Subcategory   Domain	Applicability	Informative References
AM-6   XFC/EVSE	Additional relevant parties for EVSE manufactures will include elements of the workforce involved in equipment design/usage, pre/post-sales support, and those involved during EVSE installation design and construction.	ISA 62443-2-1:D4E1 ORG 1.3
AM-6   Cloud/Third-Party	Applicable. Extra emphasis may be placed on external partner relationships due to the requirement for externally sourced operational data.	[NIST-SP800-53r5] CP-2, PM-2, PM-29
AM-6   Utility/Building Management System	Applicable. Utilities and network building should consider defining the roles and responsibilities in context of rules and regulations that apply to the energy sector. Extra emphasis may be placed on physical security personnel to protect the physical operating environment and infrastructure against cybersecurity risks.	ISA 62443-2-1:D4E1 ORG 1.3

586 **5.1.2. Business Environment Category**

587 The organization’s mission, objectives, relevant parties, and activities are understood and  
 588 prioritized by organizations; this information is used to inform cybersecurity roles,  
 589 responsibilities, and risk management decisions.

590 In the context of the EV/XFC ecosystem, organizations will understand the business  
 591 environment for relevant parties from across domains and how it impacts their specific domain.

592 **Table 3.** Identify: Business Environment Category.

Subcategory   Domain	Applicability	Informative References
<b>BE-1:</b> The organization’s role in the supply chain is identified and communicated.	<b>Ecosystem:</b> Degree of applicability and role in the supply chain is domain specific. In general, identification of the role in the supply chain is a prerequisite for supply risk management and communication of the role facilitates definition of thresholds, service level agreements, memorandums of understanding and other commitments. Identifying and understanding relationships and interfaces with suppliers influences the organization’s role in the supply chain. The organization’s role in the supply chain is influenced by system interdependencies which may impact supply chain positions and agreements. Subcomponents (e.g., microcontrollers, sensors, electrical wiring, connectors, etc.) critical to the function of onboard controllers and management systems may be considered when identifying how supply chain roles impact goods/services.	[NIST-SP800-53r5] SR-1, SR-3
<b>BE-1   EV</b>	EV manufacturers’ role in the supply chain includes relationships and interfaces with suppliers, customers, EVSE manufacturers/operators, and cloud/third-party operators.	[ISO 21434] RQ-07-04, WP-07-01

Subcategory   Domain	Applicability	Informative References
<b>BE-1   XFC/EVSE</b>	EVSE manufacturers' role in the supply chain includes that of an equipment manufacturer, consumer/holder of data from EV owners, and a developer of tools used for communication within the EV/XFC ecosystem. EVSE owners/operators may consider following a similar path, understanding their position in the supply chain as a user/maintainer of EVSE systems and service provider to EVs.	<b>ISA 62443-2-1:D4E1</b> ORG 1.6
<b>BE-1   Cloud/Third-Party</b>	Cloud/third-party owners/operators' role in the supply chain typically includes a service provider and consumer/holder of data from other EV/XFC entities. Additionally, identified dependencies and requirements may be communicated internally and with impacted business partners.	<b>[NIST-SP800-53r5]</b> SR-1, SR-3
<b>BE-2:</b> The organization's place in critical infrastructure and its industry sector is identified and communicated.	<b>Ecosystem:</b> Transportation and energy are considered critical infrastructure sectors; however, the degree to which the subcategory applies is domain specific.	<b>[NIST-SP800-161]</b> <b>[NIST-SP800-53r5]</b> PM-8
<b>BE-2   EV</b>	EV manufacturers should consider educating/informing their customers about their vehicle's capability to charge from/communicate with various types of infrastructure safely. This may include informing EV owners of which types of charge connectors are compatible with their vehicle, when connector adapters are applicable, what charge station characteristics are required (voltage, current ratings, DC/AC), or more specifically, what EVSE brands/models or third-party apps are compatible with their EV. The EV manufacturer may consider communicating the risks and/or potential consequences of failing to adhere to these recommendations.	<b>[ISO 21434]</b> RQ-10-03 <b>[NIST-SP800-161]</b> <b>[NIST-SP800-53r5]</b> PM-8
<b>BE-2   XFC/EVSE</b>	The EVSE owners/manufacturers can communicate how service/availability to EV owners could be limited and how the EVSE may behave relative to the utility during a period of lost or degraded energy availability or communications. EVSE manufacturers/owners may consider identifying the relationship of industry competitors as alternatives in the event of emergency to ensure the sustainment of critical infrastructure operation.	<b>[NIST-SP800-161]</b> <b>[NIST-SP800-53r5]</b> PM-8
<b>BE-2   Cloud/Third-Party</b>	Additionally, identified dependencies and requirements may be communicated internally and with impacted business partners. EVSE booking and alternative billing options to cloud/third-party use will be defined for use in the event of degradation or an outage.	<b>[NIST-SP800-161]</b> <b>[NIST-SP800-53r5]</b> PM-8

Subcategory   Domain	Applicability	Informative References
<b>BE-3:</b> Priorities for organizational mission, objectives, and activities are established and communicated.	<b>Ecosystem:</b> Prioritization guides the organization’s strategic activities as it operates and interfaces with customers and partners within the EV/XFC ecosystem. Current and future regulations and contractual obligations may influence the organization’s priorities. Ecosystem members can consider prioritizing operator safety and personal information security in their organizational missions, objectives, and activities.	[NIST-SP800-53r5] PM-11
<b>BE-3   EV</b>	Applicable, no EV specific considerations.	[NIST-SP800-53r5] PM-11
<b>BE-3   XFC/EVSE</b>	Applicable. EVSE manufacturers and owners/operators should consider emphasizing the cybersecurity and operational requirements of partners within the EV/XFC ecosystem in the prioritization process.	[NIST-SP800-53r5] PM-11
<b>BE-3   Cloud/Third-Party</b>	Cloud/third-party owners/operators may consider focusing more on secure communications and operational requirements/dependencies of partner organizations within the EV/XFC ecosystem in the prioritization process.	[NIST-SP800-53r5] PM-11
<b>BE-3   Utility/Building Management System</b>	Utility/Building management owners/operators may consider additional focus on stability and integrity of the grid and the operational requirements/dependencies of partner/customer organizations within the EV/XFC ecosystem in the prioritization process.	[NIST-SP800-53r5] PM-11
<b>BE-4:</b> Dependencies and critical functions for delivery of critical services are established.	<b>Ecosystem:</b> EV/XFC ecosystem members may consider understanding their position within the EV/XFC ecosystem to properly identify dependencies and critical functions, both internal and external, that may impact their delivery of goods and services to customers and partners. For example, communications between the EVSE and other systems could be a critical function for the ecosystem. In the event of primary communication disruption, redundancies or alternative communication avenues could allow operation to continue at some level and insulate downstream functions from failure propagation.	[NIST-SP800-53r5] CP-2, CP-8, PE-9, PE-11, PM-8, RA-9, SA-20, SR-2
<b>BE-4   EV</b>	Interdependencies may include finding available charging stations, making reservations, billing the transaction, and connecting to/communicating with the charging station. EVs that do not communicate correctly with the EV charger and/or cloud could incorrectly pay for services, leak PII, or cause harm to the EV, EVSE, utility/building infrastructure, or user/owner.	[ISO 21434] RQ-15-01, RQ-15-02

Subcategory   Domain	Applicability	Informative References
<b>BE-4   XFC/EVSE</b>	EVSE manufacturers may consider understanding their position in the EV/XFC ecosystem, both as an equipment manufacturer/supplier and provider, that others depend upon. EVSE manufacturers will recognize that providing safe and reliable patches as well as support to operators, is a critical function. EVSE owners/operators may consider following a similar path, understanding their position in the ecosystem as a service provider with multi-directional dependencies and critical functions. Interdependencies may include receiving utility power to transform for EV, receiving booking requests from EV via Cloud apps, and effective collaboration with third parties to charge EV owners for purchase.	<b>ISA 62443-2-1:D4E1</b> AVAIL 1.2
<b>BE-4   Cloud/Third-Party</b>	Cloud/Third-party owners/operators may have layered dependencies due to being a service provider, as well as partner of and consumer/holder of data from other EV/XFC entities. Depending upon organizational and operational designs, the cloud/third-party owners/operators may also provide multiple critical functions within the EV/XFC ecosystem. Interdependencies may include communications with EVSE regarding current status and availability.	<b>[NIST-SP800-53r5]</b> CP-2, CP-8, PE-9, PE-11, PM-8
<b>BE-4   Utility/Building Management System</b>	Depending upon organizational and operational designs, the utility/building management owners/operators may also provide multiple critical functions within the EV/XFC ecosystem. Interdependencies may include proper electricity rate/tariff selection to temper demand and accurate billing for services. Critical functions may include reliable distribution of power to critical loads.	<b>ISA 62443-2-1:D4E1</b> AVAIL 1.2
<b>BE-5:</b> Resilience requirements to support delivery of critical services are established for all operating states (e.g., under duress/attack, during recovery, normal operations).	<b>Ecosystem:</b> EV/XFC ecosystem members may consider defining how they will remain in business during various scenarios, including planning on how to work with partner organizations to address issues and concerns identified in the scenarios. Graceful degradation of operations and operating at reduced capacities is preferable to complete failure during attack and recovery. Resilience plans will include details for how operating states are defined, operational adjustments in each state, and necessary communications.	<b>IEC61850-90-4</b> 12.2, 14.2.4 <b>[NIST-SP800-53r5]</b> CP-2, CP-11, RA-9, SA-8, SA-20 <b>NERC CIP</b> 009-6-R1
<b>BE-5   EV</b>	EV manufacturers may consider the potential severity associated with impacts to EV owners. These requirements could include the ability to respond to a malicious EVSE/third-party or to protect the EV in the event of EV manufacturers equipment compromise. The EV manufacturer may consider how EV use may change during an ecosystem disruption and how the EV may recommend behavioral changes to the driver. For example, if a cyber-attack limits EVSE operability, the EV may recommend planning to charge at home.	<b>IEC61850-90-4</b> 12.2, 14.2.4 <b>[NIST-SP800-53r5]</b> CP-2, CP-11

Subcategory   Domain	Applicability	Informative References
<b>BE-5   XFC/EVSE</b>	EVSE manufacturers can consider providing designs and support to help EV/XFC partners achieve their resiliency targets. These requirements, for example, could include the ability to respond to malicious EV firmware. The EVSE can consider communicating how operations will continue in the event of decreased power availability. This may include changes to reservations, charge time, and pricing.	<b>ISA 62443-2-1:D4E1</b> AVAIL 1.1  <b>NIST Handbook 44</b> 3.40 S.2.1, S.2.2, S.2.3  <b>[OIML D31:2019]</b> 6.2.5.3  <b>[OIML G22:2022]</b> 4.4.9.3.1, 4.49.3.2
<b>BE-5   Cloud/Third-Party</b>	Applicable, no Cloud/Third-Party specific considerations.	<b>IEC61850-90-4</b> 12.2, 14.2.4  <b>[NIST-SP800-53r5]</b> CP-2, CP-11
<b>BE-5   Utility/Building Management System</b>	Depending on organizational and operational designs, the utility/building management owners/operators may rely on, as well as provide support to, EV/XFC partners. The utility may consider defining priorities for distribution and planning for decreased service capacity.	<b>ISA 62443-2-1:D4E1</b> AVAIL 1.1

593 **5.1.3. Governance Category**

594 The policies, procedures, and processes that manage and monitor the organization’s regulatory,  
595 legal, risk, environmental, and operational requirements are documented, reviewed, and inform  
596 the management of cybersecurity risk.

597 The EV/XFC ecosystem spans several sectors, and the domains will have unique operational  
598 requirements. There is a wide range of legal and regulatory requirements across the ecosystem.  
599 A domain may benefit from an awareness of the rest of the ecosystem’s constraints and  
600 requirements.

601 **Table 4.** Identify: Governance Category.

Subcategory   Domain	Applicability	Informative References
<b>GV-1:</b> Organizational cybersecurity policy is established and communicated.	<b>Ecosystem:</b> The policies should be developed collaboratively with external organizations within the domain to ensure consistency and should consider inputs from partner companies within the ecosystem to ensure interoperability. Additionally, policies may consider defining activities, roles, and responsibilities to manage operational systems, regulatory requirements, update and maintenance strategies, or applicable industry standards among other considerations.	<b>[NIST-SP800-53r5]</b> AC-1, AT-1, AU-1, CA-1, CM-1, CP-1, IA-1, IR-1, MA-1, MP-1, PE-1, PL-1, PM-1, PS-1, PT-1, RA-1, SA-1, SC-1, SI-1, SR-1  <b>ISO/SAE 21434</b>  <b>NERC CIP</b> 004-6-R2

Subcategory   Domain	Applicability	Informative References
GV-1   EV	Applicable, but no EV specific considerations.	<b>[ISO 21434]</b> RQ-05-01, RQ-05-02, RQ-05-03, RQ-05-04, RQ-05-05, WP-05-01
GV-1   XFC/EVSE	Applicable, but no XFC/EVSE specific considerations.	<b>ISA 62443-2-1:D4E1</b> ORG 1.1
GV-1   Cloud/Third-Party	Applicable, but no Cloud/Third-Party specific considerations.	<b>[NIST-SP800-53r5]</b> CP-1, IA-1, IR-1, MA-1, MP-1, PE-1, PL-1, PM-1
GV-1   Utility/Building Management System	Applicable, but no Utilities/Building management specific considerations.	<b>ISA 62443-2-1:D4E1</b> ORG 1.1
GV-2: Cybersecurity roles and responsibilities are coordinated and aligned with internal roles and external partners.	<b>Ecosystem:</b> Agreements with external organizations or partners are typically made in advance and documented in a SLA, MOU, or other forms of agreement. These agreements clearly define cybersecurity roles and responsibilities to properly define how their cybersecurity programs should function in a coordinated manner and allow for accountability for participant responsibilities.	<b>[NIST-SP800-53r5]</b> PM-1, PM-2, PM-29, PS-7, PS-9
GV-2   EV	Roles and responsibilities may include those involved in vehicle design, pre/post-sales support, software/firmware lifecycle activities, and supporting nominal vehicle operations such as charging, maintenance, and patching.	<b>[ISO 21434]</b> RQ-07-04, WP-07-01
GV-2   XFC/EVSE	Roles and responsibilities may include those during EVSE installation design, construction, maintenance, updating, and operation. EVSE manufacturers can also consider defining roles to better support the needs of EV/XFC partners and customers, which may follow established OT or IT processes and methods for equipment, remote services, and capabilities.	<b>ISA 62443-2-1:D4E1</b> ORG 1.3
GV-2   Cloud/Third-Party	Applicable, no Cloud/Third-Party specific considerations.	<b>[NIST-SP800-53r5]</b> PM-1, PM-2, PM-29

602 **5.1.4. Risk Assessment Category**

603 The organization understands the cybersecurity risk to organizational operations (including  
604 mission, functions, image, or reputation), organizational assets, and individuals.

605 There is a high level of interaction and interdependence of OT and IT within the EV/XFC  
606 ecosystem, so consideration of a coordinated or hybrid approach of OT and IT risk assessment is  
607 warranted.

608 **Table 5.** Identify: Risk Assessment Category.

Subcategory   Domain	Applicability	Informative References
<b>RA-1:</b> Asset vulnerabilities are identified and documented.	<b>Ecosystem:</b> Consider a robust and timely process to identify, document, and report vulnerabilities that exist in their assets. Perform periodic scanning and testing at a frequency consistent with policy and whenever there have been modifications to the system.  This ecosystem has custom assets with software performing key functions. These assets can have vulnerabilities that are not detected by typical scanning tools. Special considerations for niche firmware and software are warranted.	[NIST-SP800-53r5] CA-2, CA-5, CA-7, CA-8, PM-4, PM-15, RA-3, RA-5, SA-5, SA-11, SI-2, SI-4, SI-5  [Auto-ISAC]  [E-ISAC]  NERC CIP 007-6-R2
<b>RA-1   EV</b>	Applicable. Consider participation in forums such as Auto-ISAC to gain information regarding vulnerabilities. Known asset vulnerabilities may include accessible connector ports, ...	[ISO 21434] RQ-08-05, WP-09-01
<b>RA-1   XFC/EVSE</b>	Known asset vulnerabilities may include accessible connector ports, poor EVSE physical security, EVSE devices running outdated kernels, unsigned firmware, remotely accessible EVSE devices.	ISA 62443-2-1:D4E1 EVENT 1.9
<b>RA-1   Cloud/Third-Party</b>	Known asset vulnerabilities may include poor password protection, lack of authentication (e.g., client-side validation, unsanitized log-on fields)	NIST-SP800-53r5 CA-2, CA-5, CA-7, CA-8, PM-4, PM-15, RA-3, RA-5, SA-5, SA-11, SI-2, SI-4, SI-5
<b>RA-1   Utility/Building Management System</b>	Applicable. Consider participation in forums such as E-ISAC to gain information regarding vulnerabilities. Known asset vulnerabilities may include poor password protection, outdated control infrastructure software, and poor substation physical security.	ISA 62443-2-1:D4E1 EVENT 1.9
<b>RA-2:</b> Cyber threat intelligence is received from information sharing forums and sources.	<b>Ecosystem:</b> EV/XFC ecosystem members should consider maintaining an awareness of cyber threat intelligence sources along with cyber threat reports that relate to organizational assets. Ecosystem members may routinely review threat reports to compare with equipment catalogues and check for applicable vulnerabilities or actionable information.	[NIST-SP800-53r5] PM-15, PM-16, RA-10, SI-5  [NIST-SP800-150]  NERC CIP 007-6-R2
<b>RA-2   EV</b>	Applicable. EV manufactures may consider participation in Auto-ISAC for industry specific intelligence.	[ISO 21434] RQ-08-01, WP-08-01

609 **5.1.5. Risk Management Category**

610 The organization’s priorities, constraints, risk tolerances, and assumptions are established and  
611 used to support operational risk decisions.

612 In the context of the EV/XFC ecosystem, the risk tolerance for a particular domain may be  
613 influenced by the impact of an incident on partner organizations or the other domains.

614 **Table 6.** Identify: Risk Management Category.

Subcategory   Domain	Applicability	Informative References
<b>RM-1:</b> Risk management processes are established, managed, and agreed to by organizational stakeholders.	<b>Ecosystem:</b> Risk management processes may include, but are not limited to, supply chain, cybersecurity, assets, business environment, and regulatory governance. The established framework should potentially include risk identification, assessment, monitoring, and mitigation strategies to protect ecosystem assets. This may include data, hardware, software, networks, and facilities. Members should consider ensuring risk management strategies are aligned with the organization’s risk tolerance policies.	[NIST-SP800-53r5] PM-9, PM-28  ISA 62443-2-1:D4E1 ORG 2.1
<b>RM-1   EV</b>	Risk management processes are likely to include considerations of obligations to and from EV/XFC partners and suppliers	[ISO 21434] WP-05
<b>RM-1   XFC/EVSE</b>	Risk management processes should potentially include accounting for EV/XFC partners, suppliers and organizations like NERC and FERC.	ISA 62443-2-1:D4E1 ORG 2.1
<b>RM-1   Cloud/Third-Party</b>	Risk management processes should potentially include accounting for EV/XFC partners, web vendors, suppliers, and customers.	[NIST-SP800-53r5] PM-9, PM-28
<b>RM-1   Utility/Building Management System</b>	Risk management processes should potentially include accounting for EV/XFC partners, customers and organizations like NERC and FERC.	ISA 62443-2-1:D4E1 ORG 2.1

Subcategory   Domain	Applicability	Informative References
<p><b>RM-2:</b> Organizational risk tolerance is determined and clearly expressed.</p>	<p><b>Ecosystem:</b> Ecosystem elements may determine the risk tolerance associated with activities within the organization, such as product development, supply chain management, cybersecurity, asset management, business environment, and regulatory governance. Risk tolerance may be communicated through means such as policies, procedures, guidelines, and training programs. Risk tolerance will include special considerations for any safety, safety-critical, financial, or regulatory aspects. Organizations may communicate their risk tolerance to the other domains within the ecosystem.</p>	<p>[NIST-SP800-53r5] PM-9</p>

615 **5.1.6. Supply Chain Risk Management Category**

616 The organization’s priorities, constraints, risk tolerances, and assumptions are established and  
617 used to support risk decisions associated with managing supply chain risk. The organization has  
618 established and implemented processes to identify, assess, and manage supply chain risks.

619 Supply chain risk management (SCRM) is typically an intra-organization function, but in the  
620 context of the EV/XFC ecosystem, organizations will need to understand the partner’s SCRM so  
621 that the impacts of any risk inherited by partners is understood and kept within the level of the  
622 organization’s tolerance.

623 **Table 7. Identify: Supply Chain Risk Management Category.**

Subcategory   Domain	Applicability	Informative References
<p><b>SC-1:</b> Cyber supply chain risk management processes are identified, established, assessed, managed, and agreed to by organizational stakeholders.</p>	<p><b>Ecosystem:</b> Roles within the supply chain may include partners, suppliers, customers and service providers. These processes include activities such as cybersecurity analysis, passive/active assessments, or Cyber Threat Intelligence collection, and ingestion. Organizations should consider identifying critical components, systems, and processes related to cyber supply chain risk management. Roles and responsibilities may be established and consistently implemented across the organization. The supply chain should consider being assessed for potential cybersecurity risks, probability and impact of cyber events, and processes in place to manage risk. Management of the supply chain may include monitoring and implemented security controls across the ecosystem.</p>	<p>[NIST-SP800-53r5] PM-30, SA-9, SR-1, SR-2, SR-3, SR-5  [NIST-SP800-161]</p>
<p><b>SC-1   EV</b></p>	<p>Critical components may include the head unit system, on-board-diagnostic interface, telematic control units, central gateway modules, battery management systems, electronic control units, and communication controllers. Subcomponents (e.g., microcontrollers, sensors, electrical wiring, connectors, etc.) critical to the function of onboard controllers and management systems should be included in the evaluation of cyber supply chain risk.</p>	<p>[ISO 21434] RQ-07-04, WP-07-01</p>
<p><b>SC-1   XFC/EVSE</b></p>	<p>Critical components may include the charging station controller, power module controls, protection circuits, power conversion system, supply equipment communication controller, thermal management systems, human-machine interface, and EVSE meter equipment. Subcomponents (e.g., microcontrollers, sensors, electrical wiring, connectors, etc.) critical to the function of onboard controllers and management systems should be included in the evaluation of cyber supply chain risk.</p>	<p>[NIST-SP800-53r5] SR-1, SR-2, SR-3, SR-5  [NIST-SP800-161]</p>

Subcategory   Domain	Applicability	Informative References
SC-1   <b>Cloud/Third-Party</b>	Critical components may include physical data centers, network equipment, servers, storage devices, operating systems, and encryption mechanisms. Subcomponents (e.g., microcontrollers, sensors, electrical wiring, connectors, etc.) critical to the function of onboard controllers and management systems should consider being included in the evaluation of cyber supply chain risk.	[NIST-SP800-53r5] SR-1, SR-2, SR-3, SR-5  [NIST-SP800-161]
SC-1   <b>Utility/Building Management System</b>	Critical components may include the power distribution units, remote-controlled breakers, local circuit protection, and generation/storage grid systems. Subcomponents (e.g., microcontrollers, sensors, electrical wiring, connectors, etc.) critical to the function of onboard controllers and management systems should be included in the evaluation of cyber supply chain risk.	[NIST-SP800-53r5] SR-1, SR-2, SR-3, SR-5  [NIST-SP800-161]
SC-2: Suppliers and third-party partners of information systems, components and services are identified, prioritized, and assessed using a cyber supply chain risk assessment process.	<b>Ecosystem:</b> Assessments may include ecosystem partners, suppliers, customers, and service providers. Organizations may consider suppliers and partners involved in the development, manufacturing, and distribution of assets. Suppliers and partners should consider being prioritized based on risk and potential impact to the ecosystem. Risks should consider being assessed if suppliers and partners have proper policies, procedures, and security controls in place to mitigate the cybersecurity risks.	[NIST-SP800-53r5] PM-9, RA-3, SA-15, SR-2, SR-3, SR-5, SR-6  [NIST-SP800-161] 2.2, 3
SC-2   EV	Applicable, but no EV specific considerations.	[ISO 21434] RQ-07-04, WP-07-01
SC-2   XFC/EVSE	Some of the equipment used within the XFC/ EVSE is highly specialized with a limited supply chain. Organizations can consider this specialized nature when determining and managing supply chain risk.	[NIST-SP800-161] 2.2, 3
SC-2   <b>Cloud/Third-Party</b>	Applicable, but no Cloud/Third-Party specific considerations.	[NIST-SP800-161] 2.2, 3
SC-2   <b>Utility/Building Management System</b>	Applicable, but no Utility/Building Management specific considerations.	[NIST-SP800-161] 2.2, 3

Subcategory   Domain	Applicability	Informative References
<p><b>SC-3:</b> Contracts with suppliers and third-party partners are used to implement appropriate measures designed to meet the objectives of an organization's cybersecurity program and Cyber Supply Chain Risk Management Plan.</p>	<p><b>Ecosystem:</b> Consider contractual measures such as customer- and multi-level service-level agreements (SLAs), bilateral contracts, cost-plus contracts, etc. These measures must be negotiated and agreed upon in advance and include performance language. Ecosystem members may consider establishing contractual agreements with suppliers and third-party partners that enforce cybersecurity requirements to protect confidentiality, integrity, and availability of information. Contractual agreements will include security control, monitoring, and incident response requirements.</p>	<p>[NIST-SP800-53r5] SA-4, SA-9, SR-2, SR-3, SR-5</p>
<p>SC-3   EV</p>	<p>Applicable, but no EV specific considerations.</p>	<p>[ISO 21434] RQ-07-04, WP-07-01</p>

<b>SC-5   Utility/Building Management System</b>	Applicable, but no Utility/Building Management specific considerations.	<b>ISA 62443-3-3:2013</b> SR 2.8, SR 3.3, SR.6.1, SR 7.3, SR 7.4

624 **5.2. Protect Function Considerations Across the EV/XFC Domains**

625 The Protect Function defines activities that support the ability to limit or contain the impact of a  
626 potential cybersecurity event. Develop and implement the appropriate safeguards to ensure  
627 delivery of critical infrastructure services.

628 The Protect Function consists of six Categories:

- 629 • Identity Management, Authentication, and Access Control
- 630 • Awareness and Training
- 631 • Data Security
- 632 • Information Protection Processes and Procedures
- 633 • Maintenance
- 634 • Protective Technology

635 **5.2.1. Identity Management, Authentication and Access Control Category**

636 Access to physical and logical assets and associated facilities is limited to authorized users,  
637 processes, and devices, and is managed consistent with the assessed risk of unauthorized access  
638 to authorized activities and transactions. Relative to other cyber-ecosystems, the EV/XFC will  
639 need to provide greater access to external organizations to function. Consider more granular  
640 levels of identity management, authentication, and access controls to strike a balance between  
641 limiting exposure and allowing sufficient access.

**Table 8.** Protect: Identity Management, Authentication and Access Control.

Subcategory   Domain	Applicability	Informative References
<p><b>AC-1:</b> Identities and credentials are issued, managed, verified, revoked, and audited for authorized devices, users, and processes.</p>	<p><b>Ecosystem:</b> Consider implementing formal procedures and guidelines to issue, manage, and verify identities and credentials. Credential management may be performed by an independent entity. This may include the management of authentication mechanisms (e.g., single-factor, multi-factor) and unique identifiers, such as usernames, passwords, certificates, biometrics, smart cards, and hardware tokens. Implement mechanisms to track, log, approve, and audit access attempts and activities of devices within the ecosystem. Identities/credentials stored within the ecosystem may include manufacturer identities, employee identities, supplier identities, provider identities, device identities, test &amp; validation certificates, software certificates, and system administration credentials. Credentials will be promptly accredited and decommissioned when issued and revoked.</p>	<p><b>[NIST-SP800-53r5]</b> IA-1, IA-2, IA-3, IA-4, IA-5, IA-6, IA-7, IA-8, IA-9, IA-10, IA-11, IA-12</p> <p><b>NERC CIP</b> 004-6-R4, 007-6-R5</p>

Subcategory   Domain	Applicability	Informative References
AC-7   EV	Transactions and interactions may include remote vehicle access by both user and manufacturer as well as interfaces with EVSE networks.	[NIST-SP800-53r5] AC-14, IA-2, IA-3, IA-5, IA-8, IA-9, IA-10
AC-7   XFC/EVSE	Transactions and interactions may include remote access to devices, interfaces with physical devices such as EVs, cloud/third-party systems, and utility/building management systems.	ISA 62443-3-3:2013 SR 1.1, SR 1.2, SR 1.5, SR 1.7, SR 1.8, SR 1.9, SR 1.10
AC-7   Cloud/Third-Party	Transactions and interactions may include network links to/from EVs, EVSE systems, web vendors, and utility/building management systems.	[NIST-SP800-53r5] AC-14, IA-2, IA-3, IA-5, IA-8, IA-9, IA-10
AC-7   Utility/Building Management System	Transactions and interactions may include network links to/from EVSE and cloud/third-party systems, as well as other utility/building management systems and assets.	ISA 62443-3-3:2013 SR 1.1, SR 1.2, SR 1.5, SR 1.7, SR 1.8, SR 1.9, SR 1.10

643 **5.2.2. Awareness and Training Category**

644 The organization’s personnel and partners are provided cybersecurity awareness education and  
645 are trained to perform their cybersecurity-related duties and responsibilities consistent with  
646 related policies, procedures, and agreements.

647 The Awareness and Training category is not unique to the EV/XFC ecosystem, and like other  
648 cyber-ecosystems, focuses on privileged users who operate, monitor, and maintain systems and  
649 interfaces.

650 **Table 9.** Protect: Awareness and Training Category.

Subcategory   Domain	Applicability	Informative References
AT-1: All users are informed and trained.	<b>Ecosystem:</b> User training may be recurring and include information about how to interact correctly with the system as well as education about common cybersecurity methods and warning signs before, during, and after an attack or incident.	[NIST-SP800-53r5] AT-2, PM-13, PM-14
AT-1   EV	This may include staff at multiple levels, from administrative staff to design and manufacturing staff. EV manufacturers may consider including EV owner cybersecurity information and recommend best practices in the vehicle manual. Information provided in the manual may include the recommended use of multifactor authentication, PIN, and recommended settings.	[NIST-SP800-53r5] AT-2, PM-14
AT-1   XFC/EVSE	This may include staff at multiple levels, from administrative staff to design, manufacturing, maintenance, and operations staff.	ISA 62443-2-1:D4E1 ORG 1.4

Subcategory   Domain	Applicability	Informative References
AT-1   Cloud/Third-Party	This may include staff at multiple levels, from administrative and operations staff to EV/XFC partners and vendors. App developers can consider encouraging positive cyber practices among users of the app, like multifactor identification and strong passwords, as well as incorporating good cyber coding practices and assessments.	[NIST-SP800-53r5] AT-2, PM-14
AT-1   Utility/Building Management System	Applicable, but no Utility/Building Management specific considerations.	ISA 62443-2-1:D4E1 ORG 1.4
AT-2: Privileged users understand their roles and responsibilities.	<b>Ecosystem:</b> Privileged users include (but are not limited to) admin/root users/accounts, system administrators, and developers. Ecosystem members can consider clearly defining and routinely updating roles and responsibilities, and then implement training programs to help privileged users understand and abide by their roles and responsibilities. Awareness levels should be continually tested, reevaluated, and retrained to help maintain system security. Privileged user-specific training will emphasize elevated attacker desire to compromise privileged accounts and the consequences of breaches.	[NIST-SP800-53r5] AT-3, PM-13 [NIST-SP800-161] Appendix E
AT-2   EV	Applicable, but no EV specific considerations.	[NIST-SP800-53r5] AT-3, PM-13
AT-2   XFC/EVSE	Applicable, but no EVSE specific considerations.	[NIST-SP800-53r5] AT-3, PM-13
AT-2   Cloud/Third-Party	Applicable, but no Cloud/Third-Party specific considerations.	[NIST-SP800-53r5] AT-3, PM-13
AT-2   Utility/Building Management System	Applicable, but no Utility/Building Management specific considerations.	[NIST-SP800-53r5] AT-3, PM-13
AT-3: Third-party stakeholders (e.g., suppliers, customers, partners) understand their roles and responsibilities.	<b>Ecosystem:</b> Members can consider clearly defining and routinely updating roles and responsibilities and then implementing training programs to help third-party relevant parties understand and abide by their roles and responsibilities. Awareness levels should be continually tested, reevaluated, and retrained to maintain system security. Understanding roles and responsibilities may include identifying ways in which cybersecurity may be compromised and common preventative measures.	[NIST-SP800-53r5] AT-3, PS-7, SA-9
AT-3   EV	Applicable, but no EV specific considerations.	[NIST-SP800-53r5] AT-3, PS-7
AT-3   XFC/EVSE	Applicable, but no EVSE specific considerations.	ISA 62443-2-1:D4E1 ORG 1.3, ORG 1.4
AT-3   Cloud/Third-Party	Applicable, but no Cloud/Third-Party specific considerations.	[NIST-SP800-53r5] AT-3, PS-7

Subcategory   Domain	Applicability	Informative References
<b>AT-3   Utility/Building Management System</b>	Applicable, but no Utility/Building Management specific considerations.	<b>ISA 62443-2-1:D4E1</b> ORG 1.3, ORG 1.4
<b>AT-4:</b> Senior executives understand their roles and responsibilities.	<b>Ecosystem:</b> The level of resources applied to cybersecurity is correlated with the level of buy-in from senior executives. Senior executives that understand their roles and responsibilities should consider providing leadership throughout the organization. Ecosystem members may consider clearly defining and routinely updating roles and responsibilities of senior executives, and then developing routine training programs to help understand and abide by those roles and responsibilities. Awareness levels may be continually tested, reevaluated, and retrained to maintain system security. Senior executive-specific training will emphasize elevated attacker desire to compromise executive accounts and the consequences of breaches.	<b>[NIST-SP800-53r5]</b> AT-3, PM-2, PM-13, PM-29
<b>AT-4   EV</b>	Applicable, but no EVSE specific considerations.	<b>[NIST-SP800-53r5]</b> PM-2, PM-13, PM-29
<b>AT-4   XFC/EVSE</b>	Applicable, but no EV specific considerations.	<b>ISA 62443-2-1:D4E1</b> ORG 1.3, ORG 1.4
<b>AT-4   Cloud/Third-Party</b>	Applicable, but no Cloud/Third-Party specific considerations.	<b>[NIST-SP800-53r5]</b> PM-2, PM-13, PM-29
<b>AT-4   Utility/Building Management System</b>	Applicable, but no Utility/Building Management specific considerations.	<b>ISA 62443-2-1:D4E1</b> ORG 1.3, ORG 1.4
<b>AT-5:</b> Physical and cybersecurity personnel understand their roles and responsibilities.	<b>Ecosystem:</b> Understanding roles and responsibilities includes clearly defining and routinely updating roles and responsibilities, and then implementing training programs to help physical and cybersecurity personnel understand and abide by their roles and responsibilities. Awareness levels should be continually tested, reevaluated, and retrained to maintain system security. Physical/cybersecurity personnel-specific training should emphasize the best practices to adopt and how to identify and report cybersecurity risks.  This should include personnel involved in design, manufacturing, maintenance, and administration/operation roles.	<b>[NIST-SP800-53r5]</b> AT-3, CP-3, IR-2, PM-13
<b>AT-5   EV</b>	Applicable, but no EV specific considerations.	<b>[NIST-SP800-53r5]</b> AT-3, IR-2, PM-13
<b>AT-5   XFC/EVSE</b>	Applicable, but no EVSE specific considerations.	<b>ISA 62443-2-1:D4E1</b> ORG 1.3, ORG 1.4
<b>AT-5   Cloud/Third-Party</b>	Applicable, but no Cloud/Third-Party specific considerations.	<b>[NIST-SP800-53r5]</b> AT-3, IR-2, PM-13

Subcategory   Domain	Applicability	Informative References
<b>AT-5   Utility/Building Management System</b>	Applicable. Utility/Building Management Systems may consider existing physical security requirements and/or regulations.	<b>ISA 62443-2-1:D4E1</b> ORG 1.3, ORG 1.4

651 **5.2.3. Data Security Category**

652 Information and records (data) are managed consistent with the organization’s risk strategy to  
653 protect the confidentiality, integrity, and availability of information.

654 The domains within the EV/XFC ecosystem may be subject to laws and regulations with specific  
655 data security requirements, and the domains may have an obligation to provide data security for  
656 partner organizations. The tools, techniques, processes, and procedures will require a level of  
657 inter-organization cooperation that other organizations do not typically encounter.

658 **Table 10.** Protect: Data Security Category.

Subcategory   Domain	Applicability	Informative References
<b>DS-1:</b> Data-at-rest is protected.	<p><b>Ecosystem:</b> Ecosystem members can consider having increased protections for sensitive, PII, or transactional data. Data-at-rest protections may be provided through measures such as:</p> <ul style="list-style-type: none"> <li>• Securing and tamper-resistant data storage.</li> <li>• Encrypting all data.</li> <li>• Restricting access to all data around a strict need and for a specified time period.</li> <li>• Monitoring and conducting regular security audits of protection mechanisms.</li> <li>• Regularly updating the software and firmware of all onboard electronic management and control systems.</li> </ul> <p>Which DAR protection measure(s) to implement is determined on a case-by-case basis in a manner that is consistent with the organization’s risk management.</p>	<p>[NIST-SP800-37r2]</p> <p>[NIST-SP800-53r5] MP-2, MP-3, MP-4, MP-5, MP-6, MP-7, MP-8, SC-28</p> <p>[NIST-SP800-175Br1]</p> <p>[NIST-SP800-209]</p> <p><b>NERC CIP</b> 004-6-R4, 004-6-R5, 011-2-R1</p>
<b>DS-1   EV</b>	Data at rest includes any information that is stored onboard electronic management and control systems within the EV. This data may include information on vehicle performance, battery performance, charging history, location history, associated accounts, and charging profiles from EV/XFC partners, and suppliers/vendors.	<p>[NIST-SP800-53r5] MP-3, MP-4, SC-28</p> <p>[NIST-SP800-175Br1]</p> <p>[NIST-SP800-209]</p>

Subcategory   Domain	Applicability	Informative References
<b>DS-1   XFC/EVSE</b>	Data at rest includes any information that is in equipment, firmware, or software within the EVSE. This data may include information from EV owners, EV/XFC partners, and suppliers/vendors as well as reservations and credentials used to access accounts and databases.	<p><b>ISA 62443-2-1:D4E1</b> CM 1.3, DATA 1.2</p> <p><b>ISA 62443-3-3:2013</b> SR 3.4, SR 4.1</p> <p><b>[OIML D31:2019]</b> 6.2.3.4</p> <p><b>NIST Handbook 44</b> 3.40 S.3.4(a)</p>
<b>DS-1   Cloud/Third-Party</b>	Data at rest includes any information that is stored in databases owned and managed by third parties. This data may include information from EV owners, EV/XFC partners, customers, and cloud and payment processing vendors. Information database access should be protected from unauthorized access and security breaches.	<p><b>[NIST-SP800-53r5]</b> MP-3, MP-4, SC-28</p> <p><b>[NIST-SP800-175Br1]</b></p> <p><b>[NIST-SP800-209]</b></p>
<b>DS-1   Utility/Building Management System</b>	Data at rest includes any information that is stored on utility servers. This data may include load forecasting and account information from EV/XFC partners, utility/building management partners, and suppliers/vendors.	<p><b>ISA 62443-2-1:D4E1</b> CM 1.3, DATA 1.2</p> <p><b>ISA 62443-3-3:2013</b> SR 3.4, SR 4.1</p>
<b>DS-2:</b> Data-in-transit is protected.	<p><b>Ecosystem:</b> Ecosystem members may consider having increased protections for sensitive, PII, or transactional data. DIT protections may be provided through measures such as:</p> <ul style="list-style-type: none"> <li>• Securing and tamper-resistant communication systems and protocols for all transmitted data.</li> <li>• Encrypting data transmitted over wired or wireless communication channels.</li> <li>• Monitoring and conducting regular security audits of protection mechanisms.</li> <li>• Error detecting/correcting protocols.</li> </ul> <p>Which DIT protection measure(s) to implement is determined on a case-by-case basis in a manner that is consistent with the organization’s risk management.</p>	<p><b>[NIST-SP800-53r5]</b> SC-8, SC-11, SC-12</p> <p><b>NERC CIP</b> 004-6-R4, 004-6-R5</p>
<b>DS-2   EV</b>	Data-in-transit includes any information that is transmitted over wired or wireless communication channels onboard electronic management and control systems within the EV. This data may include information on vehicle performance, battery performance, charging history, location and financial history, and vehicle owners from EV/XFC partners, and suppliers/vendors. Consider additional DIT protections for over-the-air (OTA) updates.	<p><b>[NIST-SP800-53r5]</b> SC-8, SC-11, SC-12</p>

Subcategory   Domain	Applicability	Informative References
<b>DS-2   XFC/EVSE</b>	EVSE owners/operators should consider encrypting all traffic leaving the EVSE.	<p><b>[PCI-DSS v4]</b></p> <p><b>ISA 62443-2-1:D4E1</b> NET 1.01, NET 1.06, NET 1.08, DATA 1.2, DATA 1.6, USER 1.16</p> <p><b>ISA 62443-3-3:2013</b> SR 3.1, SR 3.8, SR 4.1, SR 4.2</p> <p><b>[OIML D31:2019]</b> 6.2.5.2</p> <p><b>[OIML D22:2022]</b> 4.4.9</p>
<b>DS-2   Cloud/Third-Party</b>	Data in transit may include information from EV owners, EV/XFC partners, customers, and cloud and payment processing vendors. Cloud/third-party owners/operators might consider encrypting all traffic.	<p><b>[NIST-SP800-53r5]</b> SC-8, SC-11, SC-12</p> <p><b>[PCI-DSS v4]</b></p>
<b>DS-2   Utility/Building Management System</b>	Data in transit may include information from EV/XFC partners, utility/building management partners, and suppliers/vendors. Utility/building management owners/operators may consider encrypting all operational data.	<p><b>ISA 62443-2-1:D4E1</b> NET 1.01, NET 1.06, NET 1.08, DATA 1.2, DATA 1.6, USER 1.16</p> <p><b>ISA 62443-3-3:2013</b> SR 3.1, SR 3.8, SR 4.1, SR 4.2</p>
<b>DS-3:</b> Assets are formally managed throughout removal, transfer, and disposition.	<b>Ecosystem:</b> Manage assets, which may include hardware, software, information databases, and developmental/operational tools or systems and the data itself. In addition to the day-to-day management activities, formal asset management includes creating, using, and updating asset management activities or strategies.	<p><b>[NIST-SP800-53r5]</b> CM-8, MP-6, PE-16, PE-20</p> <p><b>NERC CIP</b> 011-2-R2</p>
<b>DS-3   EV</b>	Managed data may include information on vehicle performance, battery performance, charging history, location history, and vehicle owners from EV/XFC partners, and suppliers/vendors. Transfer of EV assets should include encryption and authentication protocols and should only be managed by authorized parties. Consider going through a formal provision process when updating firmware and verifying that updates can only be made by a certified party. Procedures should include guidelines for data retention, backup, and secure disposal.	<p><b>[NIST-SP800-53r5]</b> CM-8, MP-6, PE-16, PE-20</p>
<b>DS-3   XFC/EVSE</b>	Associated data may include information from EV owners, EV/XFC partners, and suppliers/vendors.	<p><b>ISA 62443-2-1:D4E1</b> COMP 1.1, USER 1.04, USER 1.05</p> <p><b>ISA 62443-3-3:2013</b> SR 4.2</p>

659 **5.2.4. Information Protection and Processes Category**

660 Security policies (that address purpose, scope, roles, responsibilities, management commitment,  
661 and coordination among organizational entities), processes, and procedures are maintained and  
662 used to manage protection of information systems and assets.

663 Due to the interdependencies within the EV/XFC ecosystem, the domains will require a greater  
664 level of inter-organization cooperation.

**Table 11.** Protect: Information Protection Processes and Procedures Category.

Subcategory   Domain	Applicability	Informative References
<p><b>IP-1:</b> A baseline configuration of information technology/industrial control systems is created and maintained, incorporating security principles (e.g., concept of least functionality).</p>	<p><b>Ecosystem:</b> The components within the IT and ICS systems should be configured in context of what is required of the component rather than what the component is capable of doing. Disabling unnecessary capabilities and limiting the functionality of devices reduces the attack surface, limits the spread of an attack in the event of a compromise, and facilitates the detection of anomalies by reducing complexity. Consider third-party systems and devices in addition to intra-organization interfaces.</p>	<p>[NIST-SP800-53r5] CM-1, CM-2, CM-3, CM-4, CM-5, CM-6, CM-7, CM-9, SA-10</p> <p>[NIST-SP800-137] Section D</p> <p>[NIST-SP800-160V1] 3.4.9, 3.4.10, 3.4.11, Appendix F, Appendix G</p> <p>NERC CIP 012-1-R1</p>

673 **5.2.6. Protective Technology Category**

674 Technical security solutions are managed to ensure the security and resilience of systems and  
675 assets, consistent with related policies, procedures, and agreements.

676 Much of the technology within the EV/XFC ecosystem is single purpose or unique to the  
677 domains within the ecosystem. COTS security solutions may need modification or tuning to  
678 function properly and avoid unintended consequences.

**Table 13.** Protect: Protective Technology Category.

680 **5.3. Detect Function Considerations Across the EV/XFC Domains**

681 Develop and implement the appropriate activities to identify the occurrence of a cybersecurity  
682 event. The activities in the Detect Function enable timely discovery of cybersecurity events.

- 683
- 684 • Anomalies and Events
  - 685 • Security Continuous Monitoring
  - 686 • Detection Processes

686 **5.3.1. Anomalies and Events**

687 Anomalous activity is detected, and the potential impact of events is understood.

688 In the context EV/XFC, anomalies that occur within domains may also impact other domains or  
689 the entire ecosystem. Agreements made in advance regarding data and event sharing between the  
690 domains warrant consideration.

691 **Table 14.** Detect: Anomalies and Events Category.

Subcategory  Domain	Applicability	Informative References
<b>AE-1:</b> A baseline of network operations and expected data flows for users and systems is established and managed.	<b>Ecosystem:</b> EV/XFC ecosystem members can consider using operational data in these baselining efforts. This baseline may be used to help behavioral anomaly detections and determine anomalous cybersecurity activities or events. Baseline information cataloged may include normal traffic levels, message formats, safe operating ranges, network/system activity, etc. Higher baseline levels of information may be kept for more critical systems.	<b>[NIST-SP800-53r5]</b> AC-4, CA-3, CM-2, SC-16, SI-4  <b>[NIST-SP800-92]</b>  <b>[NIST-SP800-161]</b> 3.3.2, 3.3.5

CM-6: External service provider activity is monitored to detect potential cybersecurity events.	<b>Ecosystem:</b> Directly applicable to the EV/XFC ecosystem. The ecosystem comprises of four distinct domains that require a level of service from each other to function.	NERC CIP 006-6-R1, 007-6-R4, 007-6-R5 [NIST-SP800-53r5] CA-7, PS-7, SA-4, SA-9, SI-4
CM-6   EV	Service provider activity may include remote access attempts and software updates to onboard electronic management and control systems. EV manufacturers may consider monitoring external service interactions with hardware components that may include the telematics units, infotainment and navigation systems, remote keyless entry systems, diagnostic ports, and charging systems.	[NIST-SP800-53r5] CA-7, PS-7, SA-4, SA-9

Subcategory   Domain	Applicability	Informative References
CM-6   XFC/EVSE	Service provider activity may include remote access attempts, configuration changes, software updates, and diagnostic tests to onboard electronic management and control systems. EVSE manufacturers can consider monitoring external service interactions with hardware components that may include metering equipment, payment processing units, communication modules, and charge control systems. EVSE owner/operators may consider implementing remote access controls for remote EVSE manufacturers.	ISA 62443-2-1:D4E1 ORG 1.1, ORG 1.3
CM-6   Cloud/Third-Party	Applicable, but no Cloud/Third-Party specific considerations.	[NIST-SP800-53r5] CA-7, PS-7, SA-4, SA-9
CM-6   Utility/Building Management System	Applicable, but no Utility/Building Management Systems specific considerations.	ISA 62443-2-1:D4E1 ORG 1.1, ORG 1.3
CM-7: Monitoring for unauthorized personnel, connections, devices, and software is performed.	<b>Ecosystem:</b> The effectiveness of this subcategory depends on the implementation of other CSF subcategories, such as putting processes in place to monitor organizational systems, controlling physical access to equipment, track and monitor assets, or maintaining change management controls.	NERC CIP 006-6-R1, 007-6-R3, 005-6-R4, 007-6-R5  [NIST-SP800-53r5] AU-12, CA-7, CM-3, CM-8, PE-6, PE-20, SI-4
CM-7   EV	This may include steps of the equipment lifecycle, from manufacture and assembly to operation and maintenance. Factors for monitoring may include new connections to communication buses, new mobile devices connections, electronics hardware access, and changes in settings.	[NIST-SP800-53r5] CM-3, CM-8, PE-6, PE-20
CM-7   XFC/EVSE	This may include steps of the equipment lifecycle, from manufacture, assembly, deployment, operation, and maintenance. Factors to monitor may include new connections to communication buses, EV identification at charging port, and opening of the EVSE enclosure.	ISA 62443-2-1:D4E1 ORG 2.2, EVENT 1.1
CM-7   Cloud/Third-Party	Applicable, but no Cloud/Third-Party specific considerations.	[NIST-SP800-53r5] CM-3, CM-8, PE-6, PE-20
CM-7   Utility/Building Management System	Applicable, but no Utility/Building Management Systems specific considerations.	ISA 62443-2-1:D4E1 ORG 2.2, EVENT 1.1
CM-8: Vulnerability scans are performed.	<b>Ecosystem:</b> Scans may be performed by the organization itself or contracted out to external parties such as red/purple team and penetration testing activities.	[NIST-SP800-53r5] RA-5  [NIST-SP800-115]
CM-8   EV	Vulnerability scans may include the telematics units, infotainment and navigation systems, remote keyless entry systems, diagnostic ports, and charging systems.	[NIST-SP800-53r5] RA-5  [NIST-SP800-115]

Subcategory   Domain	Applicability	Informative References
CM-8   XFC/EVSE	Vulnerability scans may include metering equipment, payment processing units, communication modules, and charge control systems. EVSE owners/operators may consider implementing a vulnerabilities management solution for continuous vulnerability assessment for all EVSE equipment on site's network.	ISA 62443-2-1:D4E1 ORG 2.2, EVENT 1.1
CM-8   Cloud/Third-Party	Applicable, but no Cloud/Third-Party specific considerations.	[NIST-SP800-53r5] RA-5 [NIST-SP800-115]
CM-8   Utility/Building Management System	Applicable, but no Utility/Building Management Systems specific considerations.	ISA 62443-2-1:D4E1 ORG 2.2, EVENT 1.1

698 **5.3.3. Detection Processes**

699 Detection processes and procedures are maintained, tested, and updated to ensure awareness of  
700 anomalous events.

701 This category is common to all cyber ecosystems; however, the EV/XFC ecosystem is relatively  
702 new, so additional consideration is warranted so that the most current best practices and  
703 processes may be embraced.

704 **Table 16.** Detect: Detection Processes Category.

Subcategory   Domain	Applicability	Informative References
<b>DP-1:</b> Roles and responsibilities for detection are well defined to ensure accountability.	<b>Ecosystem:</b> EV/XFC ecosystem members may consider having well-defined ecosystem-wide detection roles and responsibilities in addition to the domains' internal activities. This may include creating or updating roles and responsibilities to include or improve detection activities. Roles and responsibilities may include event detection, diagnosis, status communications, and response plan decisions or actions.	[NIST-SP800-53r5] CA-2, CA-7, PM-14
DP-1   EV	Applicable, but no EV specific considerations.	[NIST-SP800-53r5] CA-2, CA-7

705 **5.4. Respond Function Considerations Across the EV/XFC Domains**

706 The activities in the Respond Function support the ability to contain the impact of an incident by  
707 developing and implementing the appropriate responses to a detected cybersecurity attack or  
708 anomalous incident.

709 The Respond Function actions are triggered by the outputs generated by the Detect Function and  
710 the Protect Function provides the ability to execute the proper response to an incident according  
711 to a pre-defined plan.

- 712 The objectives of the Response Function are to:
- 713 • Contain events using a verified response procedure.
  - 714 • Communicate the occurrence and impact of the incident to operations and relevant
  - 715 parties.
  - 716 • Develop processes to respond to and mitigate new known or anticipated threats or
  - 717 vulnerabilities.
  - 718 • Evolve response strategies and plans based on lessons learned.

719 **5.4.1. Analysis**

720 Analysis is conducted to verify the efficacy of the response and support recovery activities.

721 In the context of the EV/XFC ecosystem, the analysis should include the efficacy of IT and OT

722 responses.

723 **Table 17.** Respond: Analysis Category.

Subcategory   Domain	Applicability	Informative References
<b>AN-1:</b> Notifications from detection systems are investigated.	<b>Ecosystem:</b> Investigations may include combining relevant notifications together, adding an initial detection system, or updating the notifications to investigate. 741 **5.4.5. Response Planning**

742 Response processes and procedures are executed and maintained after detected cybersecurity  
743 incidents.

744 Response processes and procedures are not unique to the EV/XFC ecosystem, and like other  
745 cyber-ecosystems, need to be pre-defined for a timely response to an incident and avoid  
746 ambiguities.

747 **Table 21.** Respond: Response Planning Category.

Subcategory   Domain	Applicability	Informative References
<b>RP-1:</b> Response plan is executed during or after an incident.	<b>Ecosystem:</b> The domains may consider executing response plans during or after an incident in accordance with the pre-defined threshold and document the steps and results of the response plan as it is being executed.	[NIST-SP800-53r5] CP-2, CP-10, IR-4, IR-8
<b>RP-1   EV</b>	Applicable, no EV specific considerations.	[NIST-SP800-53r5] CP-10, IR-4

Subcategory   Domain	Applicability	Informative References

748 **5.5. Recover Function Considerations Across the EV/XFC Domains**

749 Develop and implement the appropriate activities to maintain plans for resilience and to restore  
750 any capabilities or services that were impaired due to a cybersecurity event. The activities in the  
751 Recover Function support timely recovery to normal operations to reduce the impact from a  
752 cybersecurity event. Examples of outcome categories within this function include:

- 753 • Recovery Planning
- 754 • Improvements
- 755 • Communications

756 **5.5.1. Communications**

757 Restoration activities are coordinated with internal and external parties (e.g., coordinating  
758 centers, Internet Service Providers, owners of attacking systems, victims, other CSIRTs, and  
759 vendors).

760 The communications category is not unique to the EV/XFC ecosystem, and like other  
761 ecosystems, timely communications and coordinated restoration will lead to more timely  
762 recovery.

763 **Table 22.** Recover: Communications Category.

Subcategory   Domain	Applicability	Informative References
CO-1: Public relations are managed.	<b>Ecosystem:</b> Management of public relations may include different recipients such as shareholders, partners, users, and the public. The message and communications may need to be tailored in accordance with the recipients' interests. Communication in this regard may include disclosure of the event/incident, recovery plans or activities, coordination with external partners or entities.
