FIPS 140-1
Validation Certificate

Certificate No. 4

The National Institute of Standards
and Technology of the United States
of America

The Communications Security
Establishment of the Government
of Canada

The National Institute of Standards and Technology, as the United States FIPS 140-1 Cryptographic Module Validation Authority; and the Communications Security Establishment, as the Canadian FIPS 140-1 Cryptographic Module Validation Authority; hereby validate the FIPS 140-1 testing results of the Cryptographic Module identified as:

Fortezza PCMCIA *Encryption Module by National Semiconductor Corporation*

In accordance with the Derived Test Requirements for FIPS PUB 140-1, *Security Requirements for Cryptographic Modules.* FIPS-140 -1 specifies the security requirements that are to be satisfied by a cryptographic module utilized within a security system protecting *Sensitive But Unclassified Information* (United States) or *Designated Information* (Canada) within computer and communications systems (including voice systems).

Products which use the above identified cryptographic module may be labeled as complying with the requirements of FIPS-140 -1 so long as the product, throughout it's life cycle, continues to use the validated version of the cryptographic module as specified in this certificate. No reliability test has been performed and no warranty of the products by both agencies is either expressed or implied.

This certificate must include the following page that details the scope of conformance and validation authority signatures.

FIPS 140-1 provides four increasing, qualitative levels of security: Level 1, Level 2, Level 3, and Level 4. These levels are intended to cover the wide range and potential applications and environments in which cryptographic modules may be employed. The security requirements cover eleven areas related to the secure design and implementation of a cryptographic module. The scope of conformance achieved by the cryptographic modules as tested in the product identified as:

National Semiconductor Corporation Fortezza PCMCIA Encryption Module

(Part Number 990010947-200)

and tested by the Cryptographic Module Testing accredited laboratory: __InfoGard Laboratories NVLAP LAB CODE 100432__
is as follows:

Cryptographic Module Design:	Level 2	Module Interfaces:	Level 2
Roles and Services:	Level 2	Finite State Machine Model:	Level 2
Physical Security: (multi-chip standalone)	Level 2	Software Security:	Level 2
EMI / EMC:	Level 2	Self Tests:	Level 2
Key Management:	Level 2	Implementation Note #4 Applies	

Operating System Security Level N/A   is met when used in the following configuration: _____N/A_____

The following FIPS approved *Cryptographic Algorithms* are used: __SHA-1 (cert.#1); DSA and SKIPJACK by written affirmation__

The Cryptographic module also contains the following non-FIPS approved algorithms: _____KEA_____

End user queries concerning the non-FIPS approved algorithms may be directed to their respective Cryptographic Module Validation Authority.

Overall Level Achieved: 2
