NIST Announces the Release of Special Publication 800-152, A Profile for U.S. Federal Cryptographic Key Management Systems

October 30, 2015

NIST announces the publication of Special Publication (SP) 800-152, A Profile for U. S. Federal Cryptographic Key Management Systems. This document contains requirements for the design, implementation, procurement, installation, configuration, management, operation, and use of a Key Management System by U. S. Federal organizations. The Profile is based on NIST Special Publication (SP) 800-130, A Framework for Designing Cryptographic Key Management Systems (CKMS). Final comments received for final draft of SP 800-152.

Authority

This publication has been developed by NIST to further its statutory responsibility under the Federal Information Security Management Act (FISMA), Public Law (P.L.) 107-347. NIST is responsible for developing information-security standards and guidelines, including minimum requirements for Federal information systems, but such standards and guidelines shall not apply to national security systems without the express approval of appropriate Federal officials exercising policy authority over such systems. This guideline is consistent with the requirements of the Office of Management and Budget (OMB) Circular A-130, Section 8b(3), *Securing Agency Information Systems*, as analyzed in Circular A-130, Appendix IV: *Analysis of Key Sections*. Supplemental information is provided in Circular A-130, Appendix III, *Security of Federal Automated Information Resources*.

Nothing in this publication should be taken to contradict the standards and guidelines made mandatory and binding on Federal agencies by the Secretary of Commerce under statutory authority. Nor should these guidelines be interpreted as altering or superseding the existing authorities of the Secretary of Commerce, Director of the OMB, or any other Federal official. This publication may be used by nongovernmental organizations on a voluntary basis and is not subject to copyright in the United States. Attribution would, however, be appreciated by NIST.

National Institute of Standards and Technology Special Publication 800-152
Natl. Inst. Stand. Technol. Spec. Publ. 800-152, 140 pages (December 2014)
CODEN: NSPUE2

Certain commercial entities, equipment, or materials may be identified in this document in order to describe an experimental procedure or concept adequately. Such identification is not intended to imply recommendation or endorsement by NIST, nor is it intended to imply that the entities, materials, or equipment are necessarily the best available for the purpose.

There may be references in this publication to other publications currently under development by NIST in accordance with its assigned statutory responsibilities. The information in this publication, including concepts and methodologies, may be used by Federal agencies even before the completion of such companion publications. Thus, until each publication is completed, current requirements, guidelines, and procedures, where they exist, remain operative. For planning and transition purposes, Federal agencies may wish to closely follow the development of these new publications by NIST.

Organizations are encouraged to review all draft publications during public comment periods and provide feedback to NIST. All NIST Computer Security Division publications, other than the ones noted above, are available at <http://csrc.nist.gov/publications>.

Comments on this publication may be submitted to:

Reports on Computer Systems Technology

The Information Technology Laboratory (ITL) at the National Institute of Standards and Technology (NIST) promotes the U.S. economy and public welfare by providing technical leadership for the Nation's measurement and standards infrastructure. ITL develops tests, test methods, reference data, proof-of-concept implementations, and technical analyses to advance the development and productive use of information technology. ITL's responsibilities include the development of management, administrative, technical, and physical standards and guidelines for the cost-effective security and privacy of other than national security-related information in Federal information systems. The Special Publication 800-series reports on ITL's research, guidelines, and outreach efforts in information system security, and its collaborative activities with industry, government, and academic organizations.

Abstract

This Profile for U. S. Federal Cryptographic Key Management Systems (FCKMSs) contains requirements for their design, implementation, procurement, installation, configuration, management, operation, and use by U. S. Federal organizations. The Profile is based on SP 800-130, *A Framework for Designing Cryptographic Key Management Systems (CKMS)*.

KEY WORDS: access control; confidentiality; cryptographic key management system; key metadata; disaster recovery; integrity; security assessment; security policies; source authentication.

Acknowledgements

The National Institute of Standards and Technology (NIST) acknowledges and greatly appreciates contributions by all those who participated in the creation, review, and publication of this document. NIST also thanks the many public and private sector contributors whose constructive comments significantly improved its quality and usefulness. Many useful suggestions on Cryptographic Key Management that were made during the workshops held at NIST in 2009, 2010, 2012, and 2014 have been incorporated into this document.

Executive Summary

The NIST Cryptographic Key Management project covers major aspects of managing the cryptographic keys that protect sensitive, unclassified Federal information. Associated with each key is specific information (e.g., the identifier associated with its owner, its length, and acceptable uses) called metadata. The computers, software, modules, communications, and roles assumed by one or more authorized individuals when managing and using cryptographic key management services are collectively called a Cryptographic Key Management System (CKMS).

This Profile for U. S. Federal Cryptographic Key Management Systems (FCKMSs) has been prepared to assist CKMS designers and implementers in selecting the features to be provided in their “products,” and to assist Federal organizations and their contractors when procuring, installing, configuring, operating, and using FCKMSs. Other organizations may use this Profile as desired.

An FCKMS can be owned and operated by a Federal organization or by a private contractor that provides key management services for Federal organizations or other contractors performing Federal information-processing services.

This Profile is based on NIST Special Publication 800-130, entitled “A Framework for Designing Cryptographic Key Management Systems.” The Framework specifies topics that should be considered by a CKMS designer when selecting the capabilities that a CKMS will have and the cryptographic key management services it will support. This Profile replicates all of the Framework requirements that must be satisfied in a CKMS and its design documentation, and includes additional information about installing, configuring, operating and maintaining an FCKMS.

The Framework and this Profile could be used by other organizations that have security requirements similar to those specified in these documents or could be used as a model for the development of other profiles.

1 **1 Introduction**

2 This *Profile for U.S. Federal Cryptographic Key Management Systems* (FCKMSs)
3 specifies requirements for all FCKMSs¹. It is intended to assist CKMS designers and
4 implementers to select and support appropriate security services and key-management
5 functions, and to assist FCKMS procurers, administrators, service-providing
6 organizations, and service-using organizations to select appropriate CKMSs or CKMS
7 services. This Profile specifies requirements for all organizations desiring to operate or
8 use an FCKMS, either directly or under contract; makes recommendations for Federal
9 organizations having special security needs and desiring to augment the base security and
10 key management services; and suggests additional FCKMS features that may be desirable
11 for Federal organizations to implement and use now or in the future.

12
13 This Profile is based on [SP 800-130], entitled “*A Framework for Designing*
14 *Cryptographic Key Management Systems (CKMS)*,” which provides a foundation for
15 designing and implementing CKMSs. The Framework specifies requirements for
16 designing any CKMS, commercial or Federal, while this Profile provides more-specific
17 design requirements for an FCKMS, and includes additional requirements for testing,
18 procuring, installing, managing, operating, maintaining, and using FCKMSs.

19
20 Any CKMS should include the computers, communications, software, modules, facilities,
21 and the operational management roles that are assumed by individuals that protect,
22 manage, and use cryptographic keys and certain associated information, herein called
23 metadata. A CKMS includes anything that can access an unencrypted key and its
24 metadata.

25
26 A CKMS could be simple and integrated into a computer that is doing data processing for
27 one user. It could also be very complex, consisting of multiple entities that support
28 multiple networks of users in different countries having differing security requirements.

29
30 This Profile is intended to:

- 31 1. Assist CKMS designers and implementers in supporting appropriate security
32 algorithms, cryptographic key types, key metadata, and protocols for protecting
33 sensitive U.S. Federal computing applications and data;
- 34 2. Establish requirements for FCKMS testing, procurement, installation,
35 configuration, administration, operation, maintenance and usage;
- 36 3. Facilitate an easy comparison of one FCKMS with another by analyzing their
37 designs and implementations in order to understand how each meets the
38 Framework and Profile requirements; and

¹ A CKMS is intended to be the system designed and built by a CKMS designer and implementer, while an FCKMS is the system used by the Federal government, possibly after configuring the CKMS to be compliant with its needs.

- 39 4. Assist in understanding what is needed to evaluate, procure, install, configure,
40 administer, operate, and use an FCKMS that manages the cryptographic keys that
41 protect sensitive and valuable data obtained, processed, stored, and used by U.S.
42 Federal organizations and their contractors.

43

44 Designing a secure CKMS is the responsibility of CKMS designers, who must choose
45 among various key-management capabilities to be included in a product being designed
46 for a particular market. Purchasing an acceptable FCKMS or FCKMS service is the
47 responsibility of Federal procurement officials and their technical associates.
48 Managing/administering an FCKMS is the responsibility of appropriate FCKMS service
49 providers when installing, configuring, operating, and maintaining an FCKMS.

50

51 This Profile is based on the Framework, and readers of this Profile are strongly
52 encouraged to be familiar with the information in the Framework. The Framework
53 contains tutorial information that may be needed to understand the cryptographic key-
54 management topics of this Profile, but is often not repeated herein. This Profile
55 introduces each topic that is also covered in the Framework.

56

57 The Framework and this Profile could be used by other organizations that have security
58 requirements similar to those specified in these documents or could be used as a model
59 for the development of other profiles.

60 **1.1 Profile Terminology**

61 The Profile often uses terminology that is not used in the Framework. A glossary of terms
62 is provided in Appendix B, but some of the more general terms merit an introduction
63 below.

64

65 “CKMS” is used to mean any Cryptographic Key Management System that satisfies the
66 requirements of the Framework. The term refers to the system that is designed and
67 implemented, possibly with configurable options.

68

69 “FCKMS” is used to mean the CKMS that is used by the Federal government, possibly
70 after configuring a CKMS offering to meet the needs of an FCKMS service-using
71 organization. An FCKMS meets all the requirements of this Profile for its impact level
72 and provides FCKMS services for a U.S. Federal organization and/or its contractors.

73

74 An FCKMS performs the key and metadata functions that are the foundation of all
75 cryptographic key-management services needed by one or more Federal service-using
76 organizations, their employees, and the key-management service users.

77

78 This Profile uses the terms “FCKMS service-providing organization” and “FCKMS
79 service-using organization” (or “FCKMS service-provider” and “FCKMS service-user”).
80 An FCKMS service-provider may be a part of an FCKMS service-using organization or
81 may be an independent organization providing the services required by service-users
82 (e.g., under contract). Federal CKMS service-providers may be Federal organizations,

83 Federal contractors, or both. This Profile includes requirements for both FCKMS
84 service-providers and service-users.

85

86 This Profile uses the term “impact level” to refer to the information-system impact levels
87 identified in [FIPS 200]. [FIPS 200] uses the security categories in [FIPS 199] to specify
88 and define three information-system impact levels: Low, Moderate and High. The
89 security categories are based on the potential impact on an organization if certain events
90 occur that jeopardize the information and information systems needed by the organization
91 to accomplish its assigned mission, protect its assets, fulfill its legal responsibilities,
92 maintain its day-to-day functions, and protect individuals.

93

94 The Profile uses the term “security control” to refer to the security controls provided in
95 [SP 800-53] that support the executive agencies of the Federal government to meet the
96 requirements of [FIPS 200]. [SP 800-53], and [SP 800-53A] apply to all components of
97 an information system that process, store, or transmit federal information.

98

99 The term “FIPS-140 security level” refers to the security levels defined for cryptographic
100 modules in [FIPS 140]. Four levels are defined, where a level 1 cryptographic module
101 provides the least amount of protection, and a level 4 module provides the greatest
102 amount of protection. The cryptographic modules and their implemented FIPS-140
103 security levels are validated by NIST’s Cryptographic Module Validation Program
104 (CMVP).

105

106 The term “security strength” is used to measure the amount of cryptographic protection
107 that can be provided by a combination of a cryptographic algorithm and a key. Further
108 discussion of key strengths is provided in [SP 800-57 Part 1].

109

110 In CKMS and FCKMS topic discussions, statements of fact are indicated by “is” or
111 “are”; statements of permission or of probability are indicated by “may”; statements of
112 capability are indicated by “can”. Statements including “could” are used in discussing
113 possible optional or alternative actions.

114 **1.2 Scope of this Profile**

115 An FCKMS is intended for use by Federal agencies and contractors (who use
116 cryptography to protect U.S. government information) to manage all the cryptographic
117 keys and associated metadata.

118

119 While individual people are outside the scope of an FCKMS, certain roles (e.g.,
120 administrators, managers, operators, auditors, and users) that are assigned to, and
121 assumed by, one or more individuals are within the scope of an FCKMS. Physical and
122 logical interfaces between an FCKMS and any or all of these roles are within its scope.

123 **1.3 Audience**

124 This Profile is intended for CKMS designers and implementers, and FCKMS procurers,
125 installers, configuration personnel, administrators, managers, operators, and users.

126

127 Federal employees and Federal contractors are the anticipated users of the services
128 provided by a Federal CKMS. Members of the public sector could be authorized to use
129 the services of a Federal CKMS when interacting with Federal organizations and their
130 contractors.

131 **1.4 Organization**

132 **Section 1, Introduction**, introduces Cryptographic Key Management, CKMSs,
133 FCKMSs, and the Profile.

134

135 **Section 2, Profile Basics**, covers the fundamentals of the Profile and an FCKMS.

136

137 **Section 3, Goals**, defines the goals of an FCKMS.

138

139 **Section 4, Security Policies**, presents the need for and the scope of one or more policies
140 governing the management and use of an FCKMS.

141

142 **Section 5, Roles and Responsibilities**, describes various roles and responsibilities of the
143 people managing, operating, and using an FCKMS.

144

145 **Section 6, Cryptographic Keys and Metadata**, discusses cryptographic algorithms,
146 keys and metadata, various key and metadata management functions, security issues, and
147 error/damage recovery mechanisms.

148

149 **Section 7, Interoperability and Transitioning**, considers the interoperability of
150 FCKMSs and their ability to satisfy future key management needs.

151

152 **Section 8, Security Controls**, describes the security controls used to protect an FCKMS.

153

154 **Section 9, Testing and System Assurances**, describes security testing and obtaining
155 assurances that security services are being performed correctly.

156

157 **Section 10, Disaster Recovery**, discusses various FCKMS service and data backup
158 capabilities and recovering from several types of disasters.

159

160 **Section 11, Security Assessment**, discusses assessing the operation and security of an
161 FCKMS.

162

163 **Section 12, Technology Challenges**, discusses the concern with technical advances that
164 could affect the security of an FCKMS.

165

166 **Appendix A, References**, provides relevant information for accessing each publication
167 referenced herein.

168

169 **Appendix B, Glossary**, provides a glossary of terms used in this Profile.

170 **2 Profile Basics**

171 This Profile provides a structured view of a Federal CKMS, discussing security
172 provisions that **shall, should** or could be used by a Federal organization or contractor to
173 manage and protect cryptographic keys and metadata.

174 **2.1 Profile Topics and Requirements, Augmentations, and Features**

175 This Profile consists of a set of topics that is similar to the topics found in the
176 Framework. Each topic heading is typically followed by an overview of the topic, a list of
177 Framework requirements, a list of Profile requirements, a list of Profile augmentations,
178 and a list of Profile features. In some cases, there may be no applicable requirements,
179 augmentations, or features that apply to the topic.

180

181 The Framework requirements (**FRs**) in [SP 800-130] are provided in this Profile in the
182 appropriate section to provide context.

183

184 This document also specifies FCKMS requirements, recommended augmentations, and
185 suggested features. Only the properties that are necessary to conform to and comply
186 with this document are identified as requirements.

187

188 Profile requirements for all FCKMSs are indicated by “**shall**” or “**shall not**,” and are
189 numbered beginning with a “**PR**” designation. Recommended augmentations are
190 indicated by “**should**,” and are numbered beginning with a “**PA**” designation. Suggested
191 features are indicated by “**could**,” and are numbered beginning with a “**PF**” designation.
192 Profile requirements (i.e., **PRs**) are mandatory for FCKMSs, although some Profile
193 requirements are conditional (e.g., based on the [FIPS 200] impact level). Recommended
194 augmentations (i.e., **PA**s) are strongly recommended by NIST for implementation in most
195 systems. Suggested features (i.e., **PF**s) are optional features that are often intended for
196 complex or future systems. Their possible implementation is left to the stakeholders of
197 the system. Federal CKMS service-using organizations could selectively require that their
198 FCKMSs support some of the recommended augmentations or suggested features. In
199 order to easily recognize Profile requirements, augmentations and features from the
200 surrounding text, each type is presented in a table, with separate tables for PRs, PAs and
201 PFs:

202

- Column one provides the PR, PA or PF number;
- Column two identifies any related security controls in [SP 800-53], plus any additional enhancements for the impact level, when applicable; when this column is blank, no related security control has been identified; and
- Column three provides the text of the requirement, augmentation or feature.

203

204

205

206

207 The first Framework requirement and Profile requirement, recommended augmentation
208 and suggested feature are concerned with the overall conformance to the Framework and
209 Profile.

210

211 **FR:1.1** A conformant CKMS design **shall** meet all “**shall**” requirements of the
 212 Framework [SP 800-130].
 213

PR:2.1		A Federal CKMS shall satisfy all Framework requirements (FRs) and Profile requirements (PRs).
---------------	--	--

214

PA:2.1		A Federal CKMS should support Profile augmentations (PAs) that are specified by one or more of its FCKMS-using organizations.
---------------	--	---

215

PF:2.1		A Federal CKMS could support Profile features (PFs) that are specified by one or more of its FCKMS-using organizations.
---------------	--	---

216 **2.2 Rationale for Cryptographic Key Management**

217 Today’s information systems require protection against denial of authorized use of their
 218 services; unauthorized access to, or modification of, their information processing
 219 capabilities; and unauthorized destruction of their equipment and facilities. The
 220 information systems themselves must also protect the information that they contain from
 221 unauthorized disclosure, modification, and destruction. These protections may be
 222 provided by physical means, such as enclosures, locks, and guards, or they can be
 223 provided by logical means, such as cryptography, password systems, or software based
 224 access control.

225

226 Cryptography is the only means for protecting data during transmission when physical
 227 protection is cost-prohibitive or impossible to provide. Thus, cryptography is widely used
 228 when business is conducted or sensitive information is transmitted over a network.
 229 Cryptography also provides excellent protection for stored data against entities that are
 230 not authorized to obtain or modify the data.

231

232 Cryptographic protection for data requires algorithms designed specifically for that
 233 purpose. These algorithms often require the use of cryptographic keys, which are
 234 managed by an FCKMS. The combination of the cryptographic algorithms and keys of an
 235 appropriate length can be used to provide a level of protection for data; this level is
 236 commonly referred to as the security strength (see [SP 800-57 Part1] for additional
 237 information).

238

239 Cryptographic-based security requires the secure management of keys throughout their
 240 lifetime. Cryptography can reduce the scope of information management from protecting
 241 large amounts of information to protecting a key and its associated metadata (i.e.,
 242 information about the key). This Profile specifies requirements for the management of the
 243 keys used to protect sensitive Federal information and the metadata associated with those
 244 keys.

245

246 **FR:2.1** The CKMS design **shall** specify all cryptographic algorithms and supported key
 247 sizes for each algorithm used by the system.

248

249 **FR:2.2** The CKMS design **shall** specify the estimated security strength of each
 250 cryptographic technique that is employed to protect keys and their bound metadata.

251

PR:2.2	SC-13	A Federal CKMS shall support NIST-approved cryptographic algorithms, key-establishment schemes and modes of operation (as needed) in accordance with [SP 800-131A].
PR:2.3		In a Federal CKMS, information (including loaded code and parameters) rated at a Low impact level shall be protected with cryptographic algorithms and keys that provide at least 112 bits of security strength.
PR:2.4		In a Federal CKMS, information (including loaded code and parameters) rated at a Moderate impact level shall be protected with cryptographic algorithms and keys that provide at least 128 bits of security strength.
PR:2.5		In a Federal CKMS, information (including loaded code and parameters) rated at a High impact level shall be protected with cryptographic algorithms and keys that provide at least 256 bits of security strength.

252 **2.3 Keys, Metadata, Trusted Associations, and Bindings**

253 Cryptographic keys are used when applying cryptographic protection on information² or
 254 processing already-protected information³. All keys require integrity protection that
 255 should be verified before a key is used. Secret and private keys also require
 256 confidentiality protection. Before a key is used, the source of the key should be
 257 authenticated.

258

259 Information about a cryptographic key that specifies its characteristics, acceptable uses,
 260 and applicable parameters must be associated with the key. This information is called the
 261 key's metadata, and each descriptive item is called a metadata element. A key and its
 262 metadata should be logically or cryptographically linked together and then protected,
 263 either cryptographically or physically. These operations are discussed in more detail later
 264 in this Profile.

265

266 A metadata element for a key could be implicitly known by the FCKMS, but is often
 267 explicitly associated and stored with the key. Some metadata elements are sensitive to
 268 unauthorized disclosure and, therefore, require confidentiality protection. Like keys,

² For example, encrypting plaintext information to protect its confidentiality, or signing the information to protect its integrity and verify its source.

³ For example, decrypting ciphertext to obtain the original plaintext or verifying a signature to assure its continued integrity.

269 metadata needs protection against unauthorized modification, and the source should be
270 authenticated before the metadata is used. The amount of protection provided to a key
271 and its metadata should be commensurate with the [FIPS 199] security category and
272 [FIPS 200] information-system impact level of the data being protected by that key and
273 its metadata.

274

275 Keys are considered as being either static or ephemeral. Static keys are typically used
276 multiple times and are considered as being “long-term” keys. Ephemeral keys are usually
277 generated when needed and used only once; they are considered to be “short-term” keys.

278

279 A trusted association must be established between each static key and its metadata when
280 they are created by the FCKMS, and this association should be maintained throughout the
281 lifetime of the key. A trusted association can be established by a cryptographic binding
282 between a key and its metadata (e.g., a digital signature computed on a key and its
283 metadata), or by a trusted process (e.g., a face-to-face handover of metadata from an
284 entity who is known and trusted). An FCKMS should provide cryptographic binding and
285 verification functions that are used in the key and metadata distribution and management
286 processes.

287 **2.4 FCKMS Functions**

288 An FCKMS provides key and metadata management functions for cryptographic-based
289 security in user applications, such as secure data communication and storage. These
290 functions include the generation, distribution and destruction of cryptographic keys and
291 their associated metadata (See Section 6.4).

292 **2.5 CKMS Design**

293 In accordance with the Framework, any CKMS design should describe how it provides
294 cryptographic keys to the entities that will use those keys to protect sensitive data. The
295 CKMS design documentation should specify the use of each key type, where and how
296 keys can be generated, how they can be protected in storage and during delivery, and the
297 types of entities to whom they can be delivered.

298

299 **FR:2.3** A compliant CKMS design **shall** describe design selections and provide
300 documentation as required by the requirements of the Framework.

301

302 **FR:2.4** The CKMS design **shall** specify a high-level overview of the CKMS system that
303 includes:

304

a) The use of each key type,

305

b) Where and how the keys are generated,

306

c) The metadata elements that are used in a trusted association with each key type,

307

d) How keys and/or metadata are protected in storage at each entity where they

308

reside,

309

e) How keys and/or metadata are protected during distribution, and

- 310 f) The types of entities to which keys and/or metadata can be delivered (e.g., user,
 311 user device, network device).
 312

PR:2.6	SC-12	A Federal CKMS shall support the availability and security of critical cryptographic keys and their associated metadata in an FCKMS.
PR:2.7		A Federal CKMS shall be implemented in accordance with the CKMS design that is specified in the CKMS design documentation and support all the specified services, functions, and features of the design.
PR:2.8	SA-5	A Federal CKMS compliance document shall be created prior to the initial operation of an FCKMS, describing how each Profile requirement is satisfied and how each implemented augmentation and/or feature is satisfied.

313 **2.6 CKMS Profile**

314 A CKMS Profile provides the requirements that a qualifying CKMS, its implementation,
 315 and its operation must meet for a particular sector of interest, such as the Federal
 316 government. A CKMS Profile specifies how the CKMS must be designed, implemented,
 317 tested, evaluated, and operated. A CKMS Profile is a set of requirements that must be
 318 satisfied for a given impact level by a CKMS as implemented in an operational system.

319 **2.7 FCKMS Profile**

320 This FCKMS Profile (i.e., [SP 800-152]) specifies requirements, augmentations, and
 321 features for the U.S. Federal government that will allow a CKMS designer and
 322 implementer to create an FCKMS that can be used to protect Federal government
 323 information

324 **2.8 Differences between the Framework and This Profile**

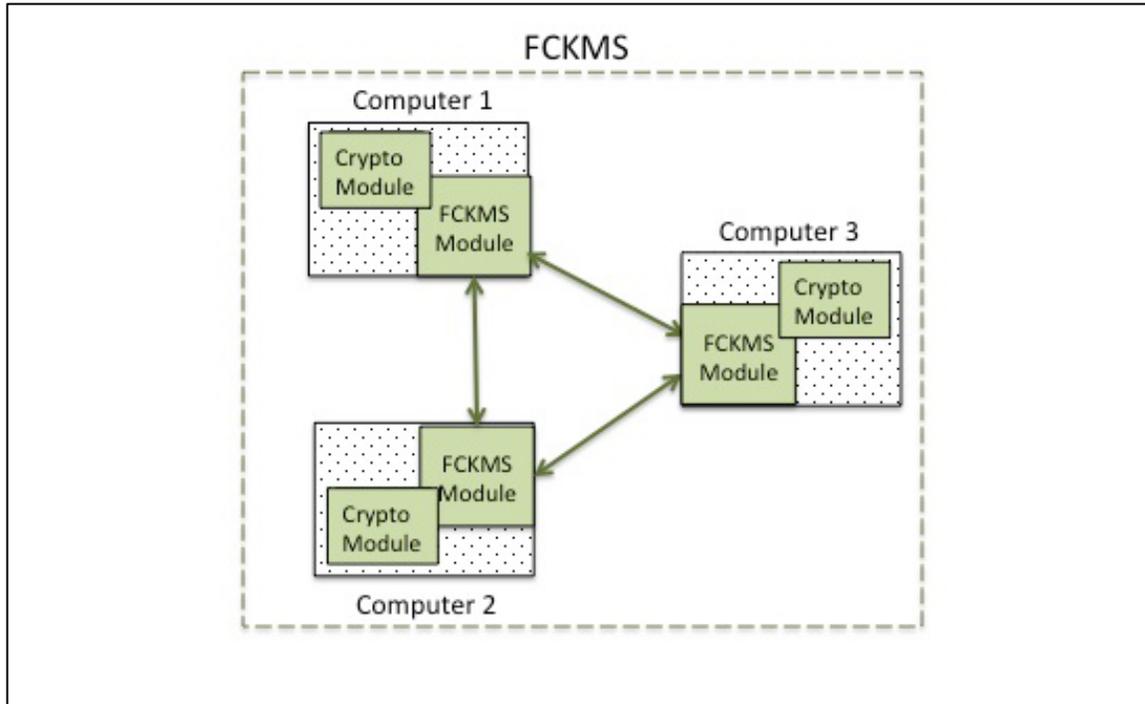

325 In the Framework, this section discusses the differences between a Framework and a
 326 profile of that Framework. Essentially, the Framework requires that specific topics be
 327 addressed during the design of a CKMS and described in design documentation. Any
 328 CKMS complies with the Framework if its design documentation satisfies all the
 329 Framework Requirements. A profile states the specific requirements that must be met in
 330 order to have a satisfactory CKMS for the designated using sector. This Profile (i.e., SP
 331 800-152) imposes specific design and implementation requirements on a CKMS that can
 332 be used as an FCKMS, and provides additional requirements for testing, procurement,
 333 installation, configuration, administration, operation, maintenance and use.

334 **2.9 Example of a Distributed CKMS Supporting a Secure E-Mail Application**

335 In the Framework, this section provides a useful example of a secure email application.
 336

337 **2.10 Modules, Devices, and Components**

338 This Profile uses the term “component” to mean any hardware, software, and/or firmware
 339 required to construct a CKMS. The term “device” denotes a combination of components
 340 that function together to serve a specific purpose. An FCKMS module is a device that
 341 performs a set of key and metadata management functions for at least one FCKMS.

342 **Figure 1: FCKMS and its FCKMS Modules**

343
 344 As shown in Figure 1, an FCKMS includes one or more computers, each with an FCKMS
 345 module that interacts with the FCKMS modules in other computers, often using a means
 346 of communication that requires cryptographic protection. An FCKMS module is the
 347 hardware and/or software that can interact with identical or compatible FCKMS modules
 348 located wherever keys and their metadata are required. Note that the FCKMS module
 349 may be implemented in hardware, software, firmware, or a combination thereof. Each
 350 FCKMS module is associated with a cryptographic module. A cryptographic module is
 351 the hardware and/or software that performs the actual cryptographic operations, e.g.,
 352 encryption, decryption and generating a digital signature. Each FCKMS module must
 353 have access to a cryptographic module that functions as a sub-module of the FCKMS
 354 module.

355
 356 The cryptographic modules used in an FCKMS must be FIPS 140-validated at an
 357 appropriate FIPS 140 security level for the impact level associated with the information
 358 that the keys will protect. A higher FIPS 140 security level than the minimum level is
 359 acceptable.

360

361 In the case of a Low impact level, the cryptographic module must (at a minimum)
 362 provide the protections available at FIPS 140 security level 2. This can be obtained by
 363 employing a cryptographic module that has been validated at level 2 or higher, or at
 364 security level 1 if the FCKMS provides physical-security protection that compensates for
 365 the level 2 physical-security requirements not included in the module, such as locks or
 366 tamper-evidence features, operating system controls, and delivery and operation.
 367 Accordingly, the higher impact levels must use cryptographic modules that provide
 368 increasingly more protection than is provided at the Low impact level, i.e., the Moderate
 369 impact level requires a level 3 cryptographic module, and the High impact level requires
 370 level 4 physical security, but at least security level 3 overall.

371
 372 **FR:2.5** The CKMS design **shall** specify all major devices of the CKMS (e.g., the make,
 373 model, and version).
 374

PR:2.9	SC-13	A Federal CKMS shall use FIPS 140-validated cryptographic modules operating in an approved-mode of operation.
PR:2.10		Each cryptographic function used by a Federal CKMS shall be implemented within a FIPS-140 validated cryptographic module.
PR:2.10	SC-13	For the protection of keys and metadata used to protect data at the Low impact level, a Federal CKMS shall employ cryptographic modules validated at FIPS 140 security level 2 or higher, or at security level 1 if the FCKMS provides compensating physical security protection.
PR:2.11	SC-13	For the protection of keys and metadata used to protect data at the Moderate impact level, a Federal CKMS shall employ cryptographic modules validated at FIPS 140 security level 3 or higher.
PR:2.12	SC-13	For the protection of keys and metadata used to protect data at the High impact level, a Federal CKMS shall employ cryptographic modules validated at FIPS 140 physical security level 4, and all other areas at security levels 3 or higher.

375

PA:2.2		A Federal CKMS should assure that all its cryptographic modules are protected against invasive and non-invasive attacks.
---------------	--	---

376 **3 Federal CKMS Goals**

377 A Federal CKMS should achieve goals and satisfy requirements that are specified in the
 378 security policies of one or more Federal organizations. The typical primary security goal
 379 of an organization is to protect its information at a level commensurate with its value,

380 sensitivity, and perceived risks. Three information-system impact levels are defined in
381 [FIPS 200]: Low, Moderate, and High. As discussed in Section 8.5, Federal
382 organizations are required to establish the appropriate impact levels for the various
383 categories of information processed, stored, and transmitted within Federal information
384 systems, based on the potential adverse impact to organizational operations, assets, or
385 individuals if such information is lost or compromised. After the impact level is
386 determined, the appropriate controls for an FCKMS may be selected from [SP 800-152A]
387 and this Profile (i.e., SP 800-152) and then assessed using [SP 800-53A].

388 **3.1 Providing Key Management to Networks, Applications, and Users**

389 The information-processing network in which an FCKMS operates is also typically used
390 as the communications backbone of both the user's applications and the FCKMS.
391 Network characteristics, such as error properties, could influence the selection of the
392 cryptographic algorithms and cryptographic modes of operation, because some modes of
393 operation extend communication errors and make the decrypted communication
394 unintelligible. Other modes can minimize the effects of a communication error.

395
396 An FCKMS could provide key management services for a single organization,
397 application, or user or for many of each. An FCKMS designed for a single application
398 could be integrated into that application, while an FCKMS supporting many applications
399 and/or users in geographically distributed locations could be distributed to wherever key
400 management services are needed and require communication networks to provide
401 interaction between the distributed applications and users.

402
403 A goal for the FCKMS is to use a set of security mechanisms that function well together,
404 provide a desired level of security that meets the needs of the application(s) and FCKMS-
405 service-using organization(s), is affordable, and has a minimum negative impact on
406 operations.

407
408 **FR:3.1** The CKMS design **shall** specify its goals with respect to the communications
409 networks on which it will function.

410
411 **FR:3.2** The CKMS design **shall** specify the intended applications that it will support.

412
413 **FR:3.3** The CKMS design **shall** list the intended number of users and the responsibilities
414 that the CKMS places on those users.

415 **3.2 Maximize the Use of COTS Products in an FCKMS**

416 Commercial Off-The-Shelf (COTS) products that are designed and produced for many
417 customers are typically less costly to acquire, operate, and maintain than custom products
418 that have been designed for one customer. A CKMS that satisfies a wide range of
419 requirements is often a goal of CKMS designers, FCKMS service providers and FCKMS
420 service users because of its reduced cost, wider market acceptance, and greater
421 interoperability among FCKMSs. A COTS CKMS could be configurable to meet the
422 special needs of any customer and, therefore, be widely accepted in the marketplace.

423

424 **FR:3.4** The CKMS design **shall** specify the COTS products used in the CKMS.

425

426 **FR:3.5** The CKMS design **shall** specify which security functions are performed by
427 COTS products.

428

429 **FR:3.6** The CKMS design **shall** specify how COTS products are configured and
430 augmented to meet the CKMS goal.

431 **3.3 Conformance to Standards**

432 An FCKMS that conforms to widely accepted security standards often increases
433 confidence in its ability to provide the desired protection, since it benefits from the
434 wisdom that went into developing the standards. If the standards have validation
435 programs that measure compliance and those validations are obtained, there is increased
436 confidence that the FCKMS has implemented that standard correctly. The use of
437 standards also fosters interoperability when different FCKMSs need to interoperate.

438

439 Tests can be created and used to assess the conformance of an FCKMS with the
440 appropriate standards. An FCKMS that has been validated as conforming to the
441 appropriate standards is generally more desirable⁴ than one that has not.

442

443 **FR:3.7** The CKMS design **shall** specify the Federal, national, and international standards
444 that are utilized by the CKMS.

445

446 **FR:3.8** For each standard utilized by the CKMS, the CKMS design **shall** specify which
447 CKMS devices implement the standard.

448

449 **FR:3.9** For each standard utilized by the CKMS, the CKMS design **shall** specify how
450 conformance to the standard was validated (e.g., by a third party testing program).

451

PR:3.1	SC-13	A Federal CKMS shall specify the Federal Information Processing Standards (FIPS) and NIST Special Publications (SPs) to which the FCKMS or FCKMS devices have been validated.
---------------	-------	--

452

PF:3.1		A Federal CKMS could conform to selected specifications of Industrial, National, and International standards for security and interoperability of the FCKMS.
---------------	--	---

⁴ Standards and conformance tests vary greatly. A security standard often establishes a metric for, or a minimum level of, security. An interoperability standard often establishes rules for independent implementations of the standard to work together. A good-practice standard often establishes rules for achieving the same level of performance by two or more parties.

453 **3.4 Ease-of-use**

454 Ease-of-use is very subjective. Something easy for one person to do may not be easy for
 455 another. An FCKMS should be easy to use by both untrained and experienced users. For
 456 example, the FCKMS could assist untrained users by performing the required actions
 457 automatically, but provide an interface for experienced users to select and use acceptable
 458 alternative actions. Negative user experiences could affect the acceptability and use of a
 459 security service or product. A Federal CKMS should be designed to support a range of
 460 user expertise and experience.

461
 462 Ease-of-use testing is discussed in Section 9.8.

463 **3.4.1 Accommodate User Ability and Preferences**

464 An FCKMS should accommodate differences in user abilities and preferences when
 465 managing their keys and metadata. Differences generally include user knowledge,
 466 experience, task familiarity, and motivation. Preferences often vary between user control
 467 and system control.

468
 469 An FCKMS could provide fully automated security services to a user or an application,
 470 based on the organizational policy. It could provide a combination of automated security
 471 services and those selected and controlled by a user or application. An FCKMS should
 472 support user control, based on organizational policy and user desires, and provide one or
 473 more security service-control interfaces for its users and managers.

474
 475 **FR:3.10** The CKMS design **shall** specify all user interfaces to the system.

476
 477 **FR:3.11** The CKMS design **shall** specify the results of any user-acceptance tests that
 478 have been performed regarding the ease of using the proposed user interfaces.

479

PA:3.1		A Federal CKMS should support user interfaces that: <ul style="list-style-type: none"> a) Require minimal user interactions with the FCKMS, b) Are commensurate with the range of experience and capability of its expected users; c) Support a user initiating the generation of cryptographic keys and associated metadata, and d) Provide one or more security service-control interfaces.
---------------	--	--

480

PF:3.2		A Federal CKMS could provide fully automated services to a user or an application, based on organizational policy.
---------------	--	---

481 **3.4.2 Design Principles of the User Interface**

482 Ease-of-use design goals should assure that:

- 483 a) It is intuitive and easy to do the right thing,
- 484 b) It is not easy to do the wrong thing, and

485 c) It is intuitive and easy to recover when a wrong thing is done.

486 **FR:3.12** The CKMS design **shall** specify the design principles of the user interface.

487

488 **FR:3.13** The CKMS design **shall** specify all human error-prevention or failsafe features
 489 designed into the system.

490

PA:3.2		A Federal CKMS should support features that are designed to detect and/or mitigate incorrect user input faults.
PA:3.3		A Federal CKMS should support user interfaces (as needed) that assist the user in selecting and using appropriate security functions and services for the key management services that they require.
PA:3.4		A Federal CKMS should support control interfaces (as needed) that are designed to support all roles selected by its FCKMS service-provider and assure that: <ul style="list-style-type: none"> a) It is intuitive to initiate and perform all supported key management service-control interactions with the FCKMS (e.g., to select and invoke a key management function); b) It is difficult to make an error or cause a security breach when initiating or interacting with an FCKMS service and c) It is easy to recover from an FCKMS service initiation or control error.

491

PF:3.3		A Federal CKMS could support the same interfaces as used by other Federal CKMSs.
---------------	--	---

492 **3.5 Performance and Scalability**

493 Performance and scalability should be considered when designing a CKMS. The
 494 performance of an FCKMS will generally depend on factors that include 1) the simplicity
 495 of the overall design, 2) the number and type of service-using organizations, 3) the
 496 sensitive applications and number of users being supported, 4) the communications
 497 capabilities and geographical distribution among the distributed components of the
 498 FCKMS, and 5) the capabilities of the computers, modules, and devices comprising it.
 499 The scalability of an FCKMS depends on such factors as the flexibility of the underlying
 500 CKMS design and implementation to support increasing service demands, and the ability
 501 to replace or upgrade its components and software.

502

503 **FR:3.14** The CKMS design **shall** specify the performance characteristics of the CKMS,
 504 including the average and peak workloads that can be handled for the types of functions
 505 and transactions implemented, and the response times for the types of functions and
 506 transactions under those respective workloads.

507
 508 **FR:3.15** The CKMS design **shall** specify the techniques that are supported and can be
 509 used to scale the system to increased workload demands.

510
 511 **FR:3.16** The CKMS design **shall** specify the extent to which the CKMS can be scaled to
 512 meet increased workload demands. This **shall** be expressed in terms of additional
 513 workload, response times for the workload, and cost.

514

PR:3.2		A Federal CKMS shall be scalable to support increasing numbers of FCKMS-service users and their computers, communications, and sensitive applications.
PR:3.3		A Federal CKMS-using organization shall identify the maximum design capacity (e.g., the maximum number of users, FKCMS modules, and applications to be supported by its FCKMS and its associated communication mechanisms.

515 **3.6 Intellectual Property Rights**

516 A goal of any system is to avoid complex and expensive litigation. Intellectual property
 517 rights, such as copyrights, trademarks, and patents should be respected as required by
 518 law. Therefore, it is best to know and resolve possible legal issues as soon as possible.

519

PA:3.5		Federal CKS service-providing organizations should identify intellectual-property rights that apply to the design, procurement, implementation, and operation of a new or upgraded FCKMS.
---------------	--	--

520 **4 Security Policies**

521 An organization often creates and supports layered security policies, with high-level
 522 policies addressing the management of its information and lower-level policies specifying
 523 the rules for protecting the information.

524

525 An organization could have different policies covering different applications or
 526 categories of information. For example, a Federal organization could have one set of
 527 policies covering its financial information and a different set of policies covering its
 528 personnel information.

529

530 This section describes a layered set of policies, including an Information Management
 531 Policy, an Information Security Policy, and an FCKMS Security Policy.

532 **4.1 Information Management Policy**

533 An organization’s Information Management Policy governs the collection, processing,
 534 and use of an organization’s information, and should specify, at a high level, what
 535 information is to be collected or created, and how it is to be managed. An organization’s
 536 management establishes this policy using industry standards of good practices, legal
 537 requirements regarding the organization’s information, and organizational goals that must
 538 be achieved using the information that the organization will be collecting and creating.

539
 540 These specifications are the foundation of an Information Security Policy (see Section
 541 4.2) and dictate the levels of confidentiality, integrity, availability, and source-
 542 authentication protections that must be provided for each category of sensitive and
 543 valuable information covered by the Information Management Policy.
 544

<p>PR:4.1</p>		<p>A Federal CKMS service-using organization shall create an Information Management Policy that:</p> <ul style="list-style-type: none"> a) Specifies the information to be collected or created and how it is to be managed; b) Specifies the high-level goals for obtaining and using the information; c) Specifies the organizational management roles and responsibilities for the policy and establishes the authorization required for people performing these information-management duties; d) Specifies what information is to be considered valuable and sensitive, and how it is to be protected; e) Specifies what categories of information need to be protected against unauthorized disclosure, modification or destruction; and f) Establishes the rules for authorizing one or more people to create policy and manage its implementation and use.
----------------------	--	---

545 **4.2 Information Security Policy**

546 An organization’s Information Security Policy is created to support and enforce portions
 547 of the organization’s Information Management Policy by specifying in more detail what
 548 information is to be protected from anticipated threats and how that protection is to be
 549 attained. A Federal organization may have different Information Security Policies
 550 covering different applications or categories of information (e.g., the policies may be
 551 different for non-personnel information than for personnel information).

552
 553 The Information Security Policy should be used to create an FCKMS Security Policy (see
 554 Section 4.3).
 555

PR:4.2	PL-1 RA-2	A Federal CKMS using-organization shall create an Information Security Policy that is consistent with the organization's Information Management Policy and specifies: <ul style="list-style-type: none"> a) The categories of information that are considered sensitive; b) The impact level associated with the sensitive information; c) The current, anticipated, and potential threats to the information; d) How the necessary protection is to be obtained; and e) The rules for collecting, protecting and distributing the sensitive information.
---------------	--------------	---

556 4.3 CKMS and FCKMS Security Policies

557 This Profile is based on the assumption that a CKMS designer will either build a product
558 that supports the specific policies of its known potential customers or one that is
559 comprehensive and flexible enough to be configured to satisfy different security policies
560 for a large number of future customers.

561
562 A CKMS designer creates a CKMS Security Policy to protect the cryptographic keys and
563 metadata used by the CKMS and to enforce restrictions associated with their use. The
564 protections should cover the entire key lifecycle, including when they are operational,
565 stored, and transported. A CKMS Security Policy includes an identification of all
566 cryptographic mechanisms and cryptographic protocols that can be used by the CKMS. A
567 CKMS designer may design a CKMS to comply with the requirements for Federal
568 systems as specified in this document.

569
570 The FCKMS Security Policy of a security domain should be derived from the
571 Information Management policies of all organizations comprising the security domain.
572 All entities that constitute a security domain are responsible for being aware of and
573 following the FCKMS Security Policy. All entities in the domain are responsible for
574 protecting the keys and associated metadata used to cryptographically protect data in
575 accordance with the FCKMS Security Policy.

576
577 An FCKMS Security Policy is intended to support the Information Security Policy of the
578 FCKMS service-using organization(s) by specifying the rules for managing the
579 cryptographic keys and metadata used to protect the information. An FCKMS may be a
580 configured subset of the designer's CKMS Security Policy, which specifically meets
581 Federal government requirements and also the specific requirements of the service-using
582 organization(s). See Figure 2 for an example.

583

605
606

Figure 2 depicts a CKMS Security Policy (in the top level box) with general features and capabilities, as well as optional features/capabilities that can be selected or prohibited to create a sub-policy appropriate for a specific CKMS service provider. The green text is used to indicate features that are compliant with the United States Government (USG) requirements of this document. Options A, C, and D (indicated in green text) are all approved for USG use. However, Option B (indicated by red text) is not approved. For example, Option B may involve the use of a cryptographic algorithm that is not approved for USG use. The second level boxes show three possible configurations that could be selected using the CKMS options. Configuration 1 contains Options A, C, and D; Configuration 2 contains Options A and B; and Configuration 3 contains only Option B. Configuration 1 is an FCKMS, since all its features and options are consistent with USG use. Configuration 2 can function as an FCKMS when Option A is used, but it can function only as a CKMS when Option B is used. Finally, Configuration 3 can only function as a CKMS, since the non-approved Option B is always used. Federal agencies could always use Configuration 1. They could use Configuration 2 if only Option A was selected, but they could never use Configuration 3 for sensitive U.S. Government data.

Ultimately, it is the responsibility of the FCKMS service-using organizations that use the FCKMS to assure that the FCKMS is secure. A FCKMS service-using organization must use an FCKMS that supports a security policy that is consistent with (or can be

607 configured to be consistent with) its higher-level policies (e.g., its Information
 608 Management Policy and Information Security Policy) and other applicable U.S.
 609 Government requirements. A Federal organization that is considering the procurement of
 610 a CKMS or the services of a CKMS provider should review the security policy of each
 611 candidate CKMS and verify that the CKMS has the necessary capabilities. An
 612 appropriate FCKMS Security Policy should then be created. The FCKMS Security Policy
 613 should specify the rules that can assure the availability, confidentiality, and integrity of
 614 the organization’s cryptographic keys and bound metadata that will be used to protect the
 615 sensitive information to be protected by the FCKMS. An FCKMS service-using
 616 organization should verify that its security policies are consistent with, and can be
 617 supported by, an FCKMS service provider, both administratively and technically.

618

619 The FCKMS Security Policy should specify how to protect each type of key and its
 620 associated metadata throughout their lifecycles, including when they are stored,
 621 transported, or used.

622

623 An FCKMS should assist in supporting and adopting its own security policies and
 624 implementation rules by providing tutorials to new managers and users on how its
 625 services should be managed and used. If a user can select and initiate security services for
 626 an application or category of information, then the FCKMS should assist in selecting
 627 appropriate security services by informing the user about the rules and how the rules can
 628 and should be followed.

629

630 **FR:4.1** The CKMS design **shall** specify the CKMS Security Policy, including the
 631 configurable options and sub-policies that it is designed to enforce.

632

633 **FR:4.2** The CKMS design **shall** specify how the CKMS Security Policy is to be enforced
 634 by the CKMS (e.g., the mechanisms used to provide the protection required by the
 635 policy).

636

637 **FR:4.3** The CKMS design **shall** specify how any automated portions of the CKMS
 638 Security Policy are expressed in an unambiguous tabular form or a formal language (e.g.,
 639 XML or ASN.1), such that an automated security system (e.g., table driven or syntax-
 640 directed software mechanisms) in the CKMS can enforce them.

641

PR:4.3	PL-1	A Federal CKMS shall have an FCKMS Security Policy that is consistent with the higher-level security policies of its service-using organization(s).
PR:4.4		A Federal CKMS shall support its FCKMS Security Policy.
PR:4.5	PL-1	A Federal CKMS shall make its FCKMS Security Policy available to all its FCKMS service-using organizations and their authorized users.

PR:4.6	AT-2	A Federal CKMS shall educate its users and managers about the security policies relevant to the FCKMS and the use of the FCKMS in accordance with those policies.
---------------	------	--

642

PA:4.1		<p>The FCKMS Security Policy should specify the following:</p> <ul style="list-style-type: none"> a) The names of the organization(s) adopting the policy; b) Who (person, title or role) is authorized to approve/modify the policy, c) The impact levels of information that are specified in and controlled by the policy, d) The primary data and key/metadata protection services (i.e., data confidentiality, data integrity, source authentication) that are to be provided by the FCKMS, e) The personnel security services (e.g., personal accountability, personal privacy, availability, anonymity, unlinkability, unobservability) that can be supported by the FCKMS, f) The metadata that specify the sensitivity or handling restrictions of the keys and their metadata, g) The algorithms and all associated parameters to be used for each impact level and with each protection service, h) The expected maximum lifetime of keys and metadata for each cryptographic algorithm used, i) The acceptable methods of user and source authentication for each information impact level to be protected by a key and its associated metadata, j) The backup, archiving and recovery requirements for keys and metadata at each information impact level, k) The roles to be supported by the FCKMS, l) The access control and physical security requirements for the FCKMS's keys and metadata for each impact level, m) The means and rules for recovering keys and metadata, and n) The communication protocols to be used when protecting sensitive data, keys, and metadata.
---------------	--	--

643

644

645

646

647

648

649

650

A security policy should be written so that the people responsible for managing and using the policy can understand the goals of the policy and can follow its implementation rules. A security policy could be encoded in an electronic form (e.g., a policy specification formal language, table of security rules, computer program) such that an FCKMS could automatically support and enforce parts of the policy. Automated security policy support systems could be programmed to detect security problems and resolve them in accordance with the policy.

651
 652 Security policy specifications can be described in a formal language that can be used to
 653 explicitly define the syntax (i.e., acceptable sentences) of an organization's policy such
 654 that a computer program can recognize and follow the rules of the policy. These rules
 655 could be called the semantics (i.e., acceptable meaning) of each sentence of the language.
 656 The semantics of a key management language sentence define the functions to be
 657 performed on keys by an FCKMS. If a security policy is encoded correctly, a Federal
 658 CKMS could support and enforce it.
 659

PF:4.1		A Federal CKMS could support its administrators in assessing a security policy for completeness and enforceability.
---------------	--	--

660 **4.4 FCKMS Module Security Policy**

661 As shown in Figure 1 of Section 2.10, an FCKMS may consist of one or more computers
 662 containing an FCKMS module, with an associated cryptographic module. The computer
 663 could, in fact, have more than one FCKMS module and more than one cryptographic
 664 module. Each FCKMS module is designed to support one or more FCKMSs, along with
 665 their FCKMS Security Policies.
 666

667 Each FCKMS module must have its own FCKMS Module Security Policy, which
 668 supports one or more FCKMS Security Policies. However, the security policy for an
 669 FCKMS module may not be a full FCKMS Security Policy. The FCKMS Module
 670 Security Policy need only deal with the subset of the FCKMS Security Policy that applies
 671 to the module itself.
 672

673 Figure 3 depicts an example of a network consisting of three Federal Entities and three
 674 FCKMSs, each with its own FCKMS Security Policy as indicated by the colors red, blue,
 675 and green. The arrowed lines between FCKMS modules indicate communications links
 676 over which cryptographic keys and metadata may be established according to the policy
 677 indicated by the color of the line. Thus, Federal Entity 1 can establish keys with Federal
 678 Entity 2 using the blue FCKMS with the blue FCKMS Security Policy. Federal Entity 1
 679 can also establish keys with Federal Entity 3 using the red FCKMS with the red FCKMS
 680 Security Policy. Finally, Federal Entity 1 could store keys that it uses only for its own
 681 purposes using the green FCKMS with the green FCKMS Security Policy.
 682

683 Figure 3 shows that a module may function in different FCKMSs and support different
 684 FCKMS Security Policies. For example, Federal Entity 1 has a module that can support
 685 either a blue FCKMS Security Policy or a red FCKMS Security Policy. Such FCKMS
 686 modules must be capable of maintaining the separation of the keys and metadata of each
 687 FCKMS that it supports. Federal Entity 3 cannot exchange keys and metadata with
 688 Federal Entity 2 or Federal Entity 4 unless the red and blue FCKMS Security Policies are
 689 determined to be equivalent or compatible (see Section 4.11.3) by the red and blue
 690 system authorities.
 691

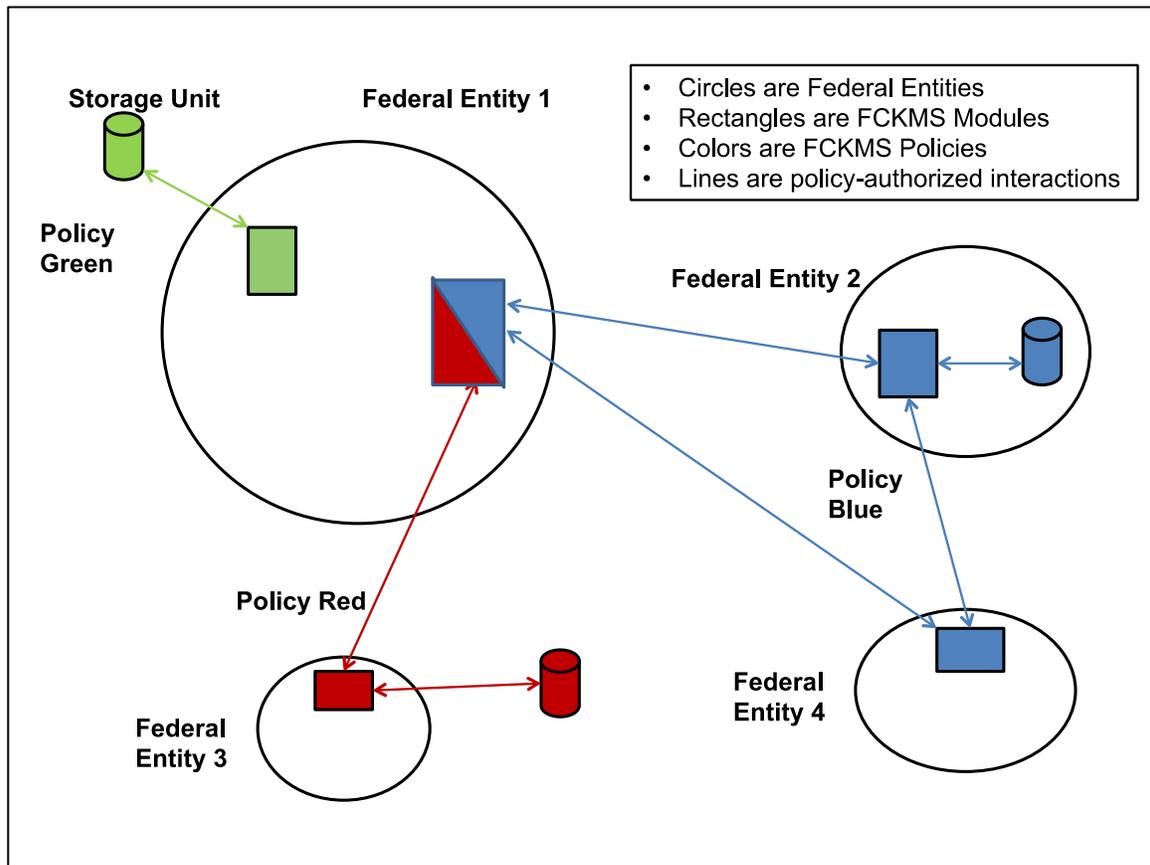

Figure 3: An FCKMS Network

692
693
694

<p>PR:4.7</p>	<p>PL-1</p>	<p>An FCKMS module shall have an FCKMS Module Security Policy that:</p> <ol style="list-style-type: none"> a) Identifies the FCKMS Security Policies that it accommodates, and b) Specifies the rules for separating keys and metadata between FCKMSs.
<p>PR:4.8</p>	<p>AC-4 (22)</p>	<p>An FCKMS module that interacts with multiple non-equivalent and non-compatible FCKMSs shall support the separation of keys and metadata of each FCKMS from each other FCKMS.</p>

695 **4.5 Cryptographic Module Security Policy**

696 A cryptographic module security policy is a statement of the rules that the cryptographic
697 module will follow when performing cryptographic functions (e.g., key generation and
698 signature verification). The cryptographic module security policy specifies the
699 mechanisms to be used to maintain the security of the module and to protect sensitive
700 data, including secret and private plaintext keys and sensitive metadata. The
701 cryptographic module security policy includes specifications for controlling access to the
702 keys and metadata, the physical security provided to protect the module’s storage and

703 processing capabilities, and the mitigation of other attacks specified in the policy. See
 704 [FIPS 140] for further information.

705 **4.6 Other Related Security Policies**

706 An FCKMS Security Policy could include or rely on other security policies or provisions,
 707 such as a Physical Security Policy, a Communications Security Policy, or a Computer
 708 Security Policy. Organizations typically develop their own physical security policies, and
 709 computer systems are often built to their own computer security policies. An organization
 710 should organize these policies in a logical structure that assigns roles for managing and
 711 enforcing the policies to appropriate parts of the organization.

712
 713 **FR:4.4** The CKMS design **shall** specify other related security policies that support the
 714 CKMS Security Policy.
 715

PA:4.2		Federal CKMS service-using organizations should coordinate with their service-providing organization in defining and supporting security policies for providing key-management services for their users.
PA:4.3		A Federal CKMS service provider should have a Computer Security Policy.
PA:4.4		An FCKMS service-using organization should create a Computer Security Policy that identifies: a) The information that is processed, communicated, and stored within its computer systems that requires protection, b) The threats that are to be protected against, and c) The detailed rules for protecting the information by computers, communication systems, and computer users.
PA:4.5		A Federal CKMS should use and support applications using computer operating systems that provide security in accordance with the FCKMS service-using organization’s Computer Security Policy.

716 **4.7 Interrelationships among Policies**

717 The Information Management Policy, Information Security Policy, Computer and
 718 Communications Security Policies, FCKMS Security Policy, FCKMS Module Security
 719 Policy, and Cryptographic Module Security Policy typically form a top-down layered set
 720 of policies in which a lower-layer policy supports the policy/policies at the higher layers.
 721 For example, an Information Management Policy for protecting certain categories of
 722 information from unauthorized disclosure may result in an Information Security Policy
 723 for encrypting data before being transmitted or stored. This Policy may dictate an
 724 FCKMS Security Policy specifying the use of symmetric encryption/decryption using a

725 specific algorithm and key length. The Cryptographic Module Security Policy would
 726 describe how the keys would be protected while in a Cryptographic Module.

727

728 **FR:4.5** The CKMS design **shall** specify the policies that are supported by the CKMS
 729 design and a summary of how they are supported by the design.

730

PR:4.9	PL-1	A Federal CKMS shall document the relationship between its policies.
PR:4.10		The security policies of a Federal CKMS shall be compatible with each other.

731 **4.8 Personal Accountability**

732 A policy of personal accountability requires that every person who accesses sensitive
 733 information be held accountable for his or her actions. Personal accountability may be a
 734 requirement in an Information Management Policy that needs to be accommodated by
 735 specific features in the FCKMS for the management of keys and metadata, such as an
 736 access control system that requires users to authenticate themselves before granting
 737 access to an FCKMS capability.

738

739 An FCKMS that supports a Personal Accountability Policy needs to be able to correctly
 740 identify each person accessing and using the FCKMS, determine who is authorized to
 741 access controlled items, grant access only upon verification of the authorization, and
 742 detect and report any attempts for unauthorized access.

743

744 **FR:4.6** The CKMS design **shall** specify if and how personal accountability is supported
 745 by the CKMS.

746

PR:4.11	AC-2 AC-3 IA-2	A Federal CKMS operating at the moderate or high impact-level shall : a) Identify entities (e.g., devices and users), b) Verify entity access authorization, c) Detect requests for unauthorized access, d) Report requests for unauthorized access, and e) Restrict the use of an FCKMS to authorized entities performing authorized activities.
PR:4.12		For moderate and high impact-level systems, a Federal CKMS shall detect attempts to bypass personal accountability policy and report each offense to the FCKMS management.

747

PA:4.6		For low impact-level systems, a Federal CKMS should : a) Identify entities (e.g., devices and users),
---------------	--	---

		<ul style="list-style-type: none"> b) Verify entity access authorization, c) Detect requests for unauthorized access, d) Report requests for unauthorized access, and e) Restrict the use of an FCKMS to authorized entities performing authorized activities.
--	--	--

748 **4.9 Anonymity, Unlinkability, and Unobservability**

749 An Information Security Policy could state that certain users or categories of users of a
 750 secure information-processing system must be assured of anonymity, unlinkability,
 751 and/or unobservability. Anonymity assures that specific information cannot be related to
 752 its owner. Unlinkability assures that two or more related events in an information-
 753 processing system cannot be related to each other. Unobservability assures that an
 754 observer is unable to identify or infer the identities of the parties involved in a
 755 transaction.

756
 757 **FR:4.7** The CKMS design **shall** specify the anonymity, unlinkability, and
 758 unobservability policies that can be supported by the CKMS.

759 **4.9.1 Anonymity**

760 An FCKMS often requires information about the identity of entities participating in
 761 FCKMS transactions (e.g., to determine the keys to be used); an entity assuming the audit
 762 role may also require this information. However, an FCKMS could protect the anonymity
 763 of the entities operating in the user role.

764
 765 **FR:4.8** The CKMS design **shall** specify which CKMS transactions have or can be
 766 provided with anonymity protection.

767
 768 **FR:4.9** The CKMS design **shall** specify how CKMS transaction anonymity is achieved
 769 when anonymity assurance is provided.

770

PR:4.13		When anonymity is required, a Federal CKMS shall assure that a key owner’s true identity cannot be determined.
----------------	--	---

771 **4.9.2 Unlinkability**

772 An FCKMS may need to link FCKMS transactions together, e.g., a transaction that
 773 requests the generation of a key, and another that uses it; an entity assuming the audit role
 774 may also require this information. However, an FCKMS could provide unlinkability
 775 protection of FCKMS transactions such that entities cannot be linked to initiating or
 776 participating in an FCKMS transaction when viewed from outside the FCKMS or by
 777 entities assuming non-audit roles within the FCKMS that are not involved with in those
 778 transactions.

779

780 **FR:4.10** The CKMS design **shall** specify which CKMS transactions have or can be
 781 provided with unlinkability protection.

782
 783 **FR:4.11** The CKMS design **shall** specify how CKMS transaction unlinkability is
 784 achieved.
 785

PR:4.14		When unlinkability is required, a Federal CKMS shall assure that no one outside an FCKMS or entities within the FCKMS that assume non-audit roles can link several transactions with each other or their initiator.
----------------	--	--

786 **4.9.3 Unobservability**

787 An FCKMS could protect transactions from being observed (i.e., monitored, recorded)
 788 and protect the identities of the entities that initiate or participate in the transactions.

789
 790 **FR:4.12** The CKMS design **shall** specify which CKMS transactions have or can be
 791 provided with unobservability protection.

792
 793 **FR:4.13** The CKMS design **shall** specify how CKMS transaction unobservability is
 794 achieved.
 795

PR:4.15		When unobservability is required, a Federal CKMS shall assure that any key management service is not observable by anyone except authorized parties.
----------------	--	---

796 **4.10 Laws, Rules, and Regulations**

797 The security policies of an organization should conform to the laws, rules, and
 798 regulations of the locality, state, and nation(s) in which its FCKMS will be used. If an
 799 FCKMS is designed for international use, then it should be flexible enough to conform to
 800 the restrictions of multiple nations.

801
 802 **FR:4.14** The CKMS design **shall** specify the countries and/or regions of countries where
 803 it is intended for use and any legal restrictions that the CKMS is intended to enforce.
 804

PR:4.16	SC-1	A Federal CKMS shall comply with U.S. Federal laws, rules and regulations.
----------------	------	---

805

PA:4.7		A Federal CKMS should comply with the rules and regulations of the countries in which it is operating and providing key management services.
---------------	--	---

806

PF:4.2		A Federal CKMS could be configurable to comply with the policies of one or more national and international
---------------	--	---

		organizations.
--	--	----------------

807 **4.11 Security Domains**

808 A security domain is a collection of entities that support the same FCKMS Security
809 Policy (see Section 4.4.1). When two mutually trusting entities are operating in the same
810 security domain, the entities can exchange keys and metadata while providing the
811 protections that are required by the FCKMS Security Policy.

812
813 Security domains can be useful when managing an organization's users and computers
814 that can connect to users and computers in other organizations. If different entities are in
815 the same Security Domain, sharing information securely is relatively easy. If they are in
816 different Security Domains, then the sharing of information becomes difficult or even
817 impossible.

818
819 When two entities are in different security domains, they may not be able to provide
820 equivalent protection to the exchanged keys and metadata because they are operating in
821 different FCKMSs under different FCKMS Security Policies. However, there are
822 circumstances in which an entity in one domain can send keys and metadata to another
823 entity in a different domain, even though their policies are not identical.

824
825 Before information is shared between entities in two or more Security Domains, their
826 FCKMS Security Policies must be carefully examined before exchanging or combining
827 their information. The domain authorities for the domains intending to share information
828 should verify that the different FCKMS Security Policies provide acceptable protection
829 for each other's data. Computers could verify the equivalence or compatibility of two or
830 more FCKMS Security Policies if they are encoded to enable such verification.

831
832 A security domain could be defined for a single information impact level (e.g., Low) or
833 could be defined for multiple impact levels (e.g., Low and Moderate). The computer
834 systems that are processing multiple levels of sensitive information must be designed,
835 programmed, and operated to separate and protect the processing of information at the
836 different impact levels.

837 **4.11.1 Conditions for Data Exchange**

838 Both the entity intending to send sensitive data to another entity in a different domain,
839 and the intended receiving entity, should satisfy the following conditions:

- 840 a) Have an acceptable means of sending and receiving the information (i.e., the
841 communications channel with agreed-upon protocols),
- 842 b) Have interoperable cryptographic capabilities (e.g., identical
843 encryption/decryption algorithms that utilize identical key lengths),
- 844 c) Have acceptable FCKMS Security Policies for exchanging information, and
- 845 d) Trust each other to enforce their FCKMS Security Policies.

846 If two entities belong to the same security domain, it is likely that these conditions can be
847 met. If the entities do not belong to the same security domain, then these conditions are
848 less likely to be satisfied. See Section 4.9.2 of the Framework for additional information.
849

850 **FR:4.15** The CKMS design **shall** specify design features that allow for the exchange of
851 keys and metadata with entities in other security domains that are considered to offer
852 equivalent but different security protections.

853 **4.11.2 Assurance of Protection**

854 Protection assurances within security domains include protecting a key and/or metadata
855 from unauthorized disclosure and unauthorized modification, as well as verifying the
856 source and destination of a key and/or metadata.
857

858 **FR:4.16** The CKMS design **shall** specify the source and destination authentication
859 policies that it enforces when sharing a key and/or metadata with entities in differing
860 security domains.

861
862 **FR:4.17** The CKMS design **shall** specify the confidentiality and integrity policies that it
863 enforces when sharing a key and/or metadata with entities in differing security domains.
864

865 **FR:4.18** The CKMS design **shall** specify what assurances it requires when
866 communicating with entities from other security domains.

867 **4.11.3 Equivalence and Compatibility of FCKMS Security Policies**

868 When entities in different security domains need to share or mix data, their respective
869 security policies must be compatible or equivalent.
870

871 Two security domains have equivalent FCKMS Security Policies if the authority
872 responsible for each security domain agrees to accept the other domain's FCKMS
873 Security Policy as being equivalent to its own FCKMS Security Policy in terms of the
874 security protections provided. If it is determined that the policies of two FCKMSs are
875 equivalent, then an entity in one security domain may share data with an entity in another
876 equivalent domain.
877

878 Two security domains are compatible if they can exchange a key and its metadata without
879 changing the protection provided to the key and metadata and without violating (or
880 altering) either domain's FCKMS Security Policy. For example, suppose that domain 1
881 allows domain 1 entities to bind keys and metadata using RSA-2048, and domain 2
882 allows domain 2 entities to receive and verify the binding on keys with RSA-2048, but
883 domain 1 does not permit using RSA-2048 for verifying the binding on keys, and domain
884 2 does not permit using RSA-2048 for binding keys. Clearly, their security policies are
885 different and not equivalent, but yet a key may be sent from a domain 1 entity to a
886 domain 2 entity because the two domains are compatible with the transaction that sends a
887 key from domain 1 to domain 2.
888

889 **FR:4.19** The CKMS design **shall** specify if and how it supports the review and
 890 verification of another domain’s security before intra-domain communications are
 891 permitted.

892
 893 **FR:4.20** The CKMS design **shall** specify how it detects, prevents or warns an entity of
 894 the possible security consequences of communicating with an entity in a security domain
 895 with weaker policies.
 896

PF:4.3		A Federal CKMS could support the authorities from different security domains in reviewing each other’s FCKMS Security Policies and verifying their equivalence or compatibility.
PF:4.4	AC-4 (20)	A Federal CKMS could support key management services for the sharing of sensitive data among two or more domains whose FCKMS security policies have been verified as being equivalent or compatible.
PF:4.5	AC-4 (20)	A Federal CKMS could support protocols that obtain an FCKMS Security Policy from a different security domain, compare the obtained policy to the local FCKMS Security Policy, and establish whether the obtained policy is equivalent or compatible to the local FCKMS Security Policy.
PF:4.6		The domain authorities of Federal CKMSs could negotiate and institute a common FCKMS Security Policy for protecting the data of both domains using the following actions: a) Agree on the common FCKMS Security Policy, b) Notify all entities of the planned FCKMS Security Policy change, c) Verify that each domain enforces the common FCKMS Security Policy.

897 **4.11.4 Third-Party Sharing**

898 When two domain authorities examine each other’s FCKMS Security Policy for
 899 equivalence or compatibility to their own FCKMS Security Policy, they should carefully
 900 examine each other’s policies for sharing keys, metadata and other information with other
 901 third-party entities. For example, if domain A shares keys with domain B, can domain B
 902 share the same key and metadata with an equivalent domain C? See the Framework for
 903 further discussion.

904 **4.11.5 Multi-level Security Domains**

905 A security domain could contain information having more than one impact level (e.g.,
 906 Moderate and High). In this case, an FCKMS must support key management for

907 protecting the information at both impact levels. For this multi-level situation, the
 908 security domain acts much like two separate security domains because it must distinguish
 909 between the two levels of protection. Each entity in the domain must ensure 1) that keys
 910 and/or metadata protected by the higher-level policy are always provided with the higher
 911 level of protection, 2) that keys and/or metadata protected by the lower-level policy
 912 cannot be confused with the higher-level keys and/or metadata, and 3) that higher-level
 913 keys and/or metadata do not get confused with lower-level keys and/or metadata. This
 914 typically involves a multi-level secure computer operating system.

915

916 **FR:4.21** The CKMS design **shall** specify whether or not it supports multi-level security
 917 domains.

918

919 **FR:4.22** The CKMS design **shall** specify each level of security domain that it supports.

920

921 **FR:4.23** If multi-level security domains are supported, the CKMS design **shall** specify
 922 how it maintains the separation of the keys and metadata belonging to each security level.

923

PF:4.7	AC-4 (20)	A multi-level Federal CKMS could support a transaction between an entity from one security domain and an entity from another security domain by: <ul style="list-style-type: none"> a) Determining if the two FCKMS Security Policies are multi-level, b) Determining if the two policies have an acceptable intersection of the level of protection that can be provided for the information to be exchanged, and c) Supporting that level of protection.
PF:4.8		A Federal CKMS could support one or more multi-level security domains.

924 **4.11.6 Upgrading and Downgrading**

925 Under certain conditions, a domain authority could decide that a key and/or metadata
 926 from an entity in a lower-level security domain (a domain providing less protection) can
 927 be accepted and protected at the higher level required by its own FCKMS Security
 928 Policy. This process is called upgrading. Upgrading should only be done if the authority
 929 responsible for the higher-level domain trusts the source and authenticity of the key
 930 and/or metadata from the lower level. Likewise, the domain authority for a higher-level
 931 security domain might need to pass a key and/or metadata to a lower-level security
 932 domain entity, requiring the protection on the key and/or metadata to be downgraded. In
 933 this case, the domain authority for the higher-level domain must be assured that the key
 934 and/or metadata being passed down only require the lower level of security provided by
 935 the receiver’s lower-level domain.

936

937 **FR:4.24** The CKMS design **shall** specify if and how it supports the upgrading or
 938 downgrading of keys and metadata.

939
 940 **FR:4.25** The CKMS design **shall** specify how upgrading or downgrading capabilities are
 941 restricted to the domain authority.
 942

PR:4.17		In a Federal CKMS, upgrading and downgrading shall be under the control of an authorized domain authority.
PR:4.18		In a Federal CKMS, a key and its associated metadata shall only be upgraded if the authority responsible for the higher-level domain trusts the source and authenticity of the key and/or metadata from the lower level domain.
PR:4.19		In a Federal CKMS, a key and its associated meta shall only be downgraded if the domain authority for the higher-level domain has determined that the key and/or metadata being passed down only requires the lower level of security provided by the lower-level domain.

943 **4.11.7 Changing FCKMS Security Policies**

944 It may be desirable to change an FCKMS Security Policy. Some FCKMSs could have
 945 been designed so that their FCKMS Security Policies can be configured to permit
 946 changes. The domain authority should approve any policy change before it is made. It is
 947 the responsibility of the Domain Authority initiating the change to inform other affected
 948 Security Domain Authorities (e.g., other domains that have been determined to be
 949 equivalent or compatible) when such changes to a security policy are made.

950
 951 **FR:4.26** The CKMS design **shall** specify if and how its key and/or metadata management
 952 functions may be configured to support differing FCKMS Security Policies and differing
 953 applications.
 954

955 **FR:4.27** The CKMS design **shall** specify if and how it can support changes in its
 956 FCKMS Security Policy by being reconfigured to accommodate communications with
 957 entities in different security domains.
 958

PR:4.20	SA-11	A Federal CKMS shall perform the following actions before a changed FCKMS Security Policy is put into effect: a) Document the new FCKMS Security Policy; b) Evaluate its potential security consequences; c) Approve the changes for the modified security domain; d) Approve and implement the required FCKMS modifications, validate their correct implementation, and then test the modified FCKMS;
----------------	-------	---

		<ul style="list-style-type: none"> e) Verify the correct and secure operation of the changed security domain protection mechanisms; and f) Coordinate with the domain authorities of other domains with which an equivalence or compatibility has previously been determined.
--	--	---

959

PF:4.9		A Federal CKMS could support the manual configuration and/or automated negotiation of modified FCKMS Security Policies for interaction with entities in different domains that are approved by all affected Security Domain authorities.
---------------	--	---

960 **5 Roles and Responsibilities**

961 An FCKMS could interface with humans who are performing specific management, user,
 962 and/or operational roles. Each role should have specific requirements for a person that
 963 will be authorized to perform it. Each person that is authorized to perform a role should
 964 be provided access to a set of key and metadata management functions that will assist in
 965 carrying out the responsibilities of the role.

966

967 Examples of FCKMS roles include, but are not limited to, the following. A description of
 968 each role is provided in the Framework.

969

- 970 a) System Authority,
- 971 b) System Administrator,
- 972 c) Cryptographic Officer,
- 973 d) Domain Authority,
- 974 e) Key Custodian,
- 975 f) Key Owner,
- 976 g) CKMS User,
- 977 h) Audit Administrator,
- 978 i) Registration Agent,
- 979 j) Key-Recovery Agent, and
- 980 k) CKMS Operator.

981

982 Multiple individuals could be assigned to perform a role, and/or one person could be
 983 authorized to perform multiple roles. The same individual should not perform certain
 984 roles indefinitely. It is prudent to periodically (and perhaps randomly) rotate individuals
 985 among different roles to minimize the likelihood of long-term abuses. All persons should
 986 be properly trained for the roles that they are assigned to perform. Highly sensitive roles
 987 may require multiple individuals to perform the role simultaneously.

988

989 **FR:5.1** The CKMS design **shall** specify each role employed by the CKMS, the
 990 responsibilities of each role, and how entities are assigned to each role.

991

992 **FR:5.2** The CKMS design **shall** specify the key and metadata management functions (see
 993 Section 6.4) that can be used by entities fulfilling each role employed by the CKMS.

994
 995 **FR:5.3** The CKMS design **shall** specify which roles require role separation.
 996

997 **FR:5.4** The CKMS design **shall** specify how the role separation is maintained for the
 998 roles that require role separation.
 999

1000 **FR:5.5** The CKMS design **shall** specify all automated provisions for identifying security
 1001 violations, whether by individuals performing authorized roles (insiders) or by those with
 1002 no authorized role (outsiders).
 1003

PR:5.1	AC-2	A Federal CKMS shall support the roles of System Authority, System Administrator, Audit Administrator and User, in addition to other roles specified in its CKMS design.
PR:5.2	AT-3	A Federal CKMS shall train FCKMS personnel to perform their respective roles and to maintain security.
PR:5.3	AC-2 AC-3 AC-5 AC-6 AC-24	A Federal CKMS shall verify the authorization of the individual initiating one or more activities while performing a role, and restrict the activities of the person performing the role to those allowed by the specification of the role.
PR:5.4	AC-5	A Federal CKMS shall ensure that a person fulfilling the role of Audit Administrator cannot fulfill additional roles other than the user role.

1004

PA:5.1		A Federal CKMS should support the roles of Cryptographic Officer, Key Custodian, and Key Owner.
PA:5.2		Other than the user role, the roles assumed in a Federal CKMS should be rotated periodically.

1005

PF:5.1		A Federal CKMS could support the roles of Domain Authority, Registration Agent, Key-Recovery Agent, and FCKMS Operator.
---------------	--	--

1006 **6 Cryptographic Algorithms, Keys, and Metadata**

1007 **6.1 Cryptographic Algorithms and Keys**

1008 Cryptographic algorithms and their keys can be categorized according to their properties
 1009 and uses. Algorithms and keys can be categorized as being symmetric (with secret keys)
 1010 or asymmetric (with key pairs, one being public and the other private). Keys can be static
 1011 (i.e., long term) or ephemeral (i.e., used only for a single secure session or key

1012 management transaction). Cryptographic algorithms can be used for signature generation,
 1013 signature verification, data integrity, entity identity verification, information encryption
 1014 and decryption, and random number generation (RNG). Each type of cryptographic
 1015 algorithm requires a type of key appropriate for that algorithm and its current application.
 1016 Key uses include signature, authentication, encryption/decryption, key wrapping, random
 1017 number generation (RNG), master key, key transport, key agreement, and authorization.
 1018 General requirements relating to cryptographic algorithms and key strengths have been
 1019 addressed in Section 2.1.

1020 **6.1.1 Key Types, Lengths and Strengths**

1021 The Framework provides a list of twenty-one key types (shown below in Table 1) and a
 1022 short description of each key type.

1023

Key Type
1) Private Signature Key
2) Public Signature Key
3) Symmetric Authentication Key
4) Private Authentication Key
5) Public Authentication Key
6) Symmetric Data Encryption/Decryption Key
7) Symmetric Key Wrapping Key
8) Symmetric RNG Key
9) Private RNG Key
10) Public RNG Key
11) Symmetric Master Key
12) Private Key Transport Key
13) Public Key Transport Key
14) Symmetric Key Agreement Key
15) Private Static Key Agreement Key
16) Public Static Key Agreement Key
17) Private Ephemeral Key Agreement Key
18) Public Ephemeral Key Agreement Key
19) Symmetric Authorization Key
20) Private Authorization Key
21) Public Authorization Key

Table 1: Key Types

1024

1025

1026 **FR:6.1** The CKMS design **shall** specify and define each key type used.

1027 All key types that are specified as being required by an FCKMS service-using
 1028 organization must be supported by the FCKMS of its FCKMS service-providing
 1029 organization.

1030

PR:6.1		A Federal CKMS shall support all the key types and lengths specified in the CKMS design.
---------------	--	---

1031 **6.1.2 Key Protections**

1032 All keys managed by an FCKMS require integrity protection. Secret and private keys
 1033 require confidentiality protection. FIPS-validated cryptographic modules have been
 1034 designed to provide this protection when used in accordance with the associated security
 1035 policy. However, when outside a FIPS-validated cryptographic module, either physical or
 1036 logical protection is required for these keys. Cryptographic protection is one form of
 1037 logical protection.
 1038

PR:6.2	SC-8 SC-11 SC-12 SC-28	A Federal CKMS shall physically or logically protect all cryptographic keys from unauthorized disclosure, use, and modification.
PR:6.3		A Federal CKMS shall support the protection of keys at the same or a higher impact level than the data to be protected by the keys.
PR:6.4	SC-8 SC-11 SC-12 SC-28	A Federal CKMS used to protect Moderate or High impact level information shall cryptographically protect all keys against unauthorized disclosure and modification when outside a cryptographic module.

1039

PA:6.1	SC-8 SC-11 SC-12 SC-28	A Federal CKMS used to protect Low impact level information should cryptographically protect all keys against unauthorized disclosure and modification when outside a cryptographic module.
---------------	---------------------------------	--

1040 **6.1.3 Key Assurance**

1041 When cryptographic keys and domain parameters⁵ are stored or distributed, they may
 1042 pass through unprotected environments. In this case, specific assurances are required
 1043 before the key and/or domain parameters may be used to perform cryptographic
 1044 operations. Assurance of integrity is needed for all keys and metadata. Assurance of
 1045 possession is needed for both secret and private keys. Assurance of domain parameter
 1046 validity is needed for certain public-key algorithms. Assurance of validity is needed for
 1047 symmetric keys and the public keys of public-key algorithms. See [SP 800-89], [SP 800-
 1048 56A] and [SP 800-56B] for further discussion. Other assurances that may be needed
 1049 include source authenticity.
 1050

⁵ Domain parameters are used in conjunction with some public-key algorithms to generate key pairs, to create digital signatures, or to establish keying material. Domain parameters are included in the metadata associated with certain keys.

PR:6.5	SI-7	A Federal CKMS shall apply integrity protection to all keys before transmission and/or storage, and verify the integrity of all keys when received or before initial use.
PR:6.6	SI-10	A Federal CKMS shall obtain the following assurances (as appropriate) before the initial operational use of a key: <ul style="list-style-type: none"> a) Domain parameter validity, b) Public-key validity, c) Private-key possession, and/or d) Secret-key possession.
PR:6.7		A Federal CKMS shall obtain all key and domain parameter assurances using NIST-approved methods.
PR:6.8		For Moderate and High impact-level systems, a Federal CKMS shall support assuring a receiver of a transported key that it came from an authenticated and authorized source.

1051

PA:6.2		For Low impact-level systems, a Federal CKMS should support assuring a receiver of a transported key that it came from an authenticated and authorized source.
---------------	--	---

1052

6.2 Key Metadata

1053

Key metadata is defined as information associated with a particular key that is managed by the FCKMS.

1054

1055

1056

The CKMS designer should select the metadata that is appropriate for a trusted association with a key based upon a number of factors, including the key type, the key lifecycle state, and the CKMS Security Policy.

1057

1058

1059

6.2.1 Metadata Elements

1060

The following are metadata elements that are described in the Framework and may be explicitly recorded. The descriptions in the Framework should be carefully reviewed when making decisions with regard to their applicability. The metadata elements are:

1061

1062

1063

1064

a) Key label,

1065

b) Key identifier,

1066

c) Owner identifier,

1067

d) Key lifecycle state,

1068

e) Key format specifier,

1069

f) Product used to create the key,

1070

g) Cryptographic algorithm using the key,

1071

h) Schemes or modes of operation,

1072

i) Parameters for the key,

1073

j) Length of the key,

- 1074 k) Security strength of the key/algorithm pair,
- 1075 l) Key type,
- 1076 m) Appropriate application(s) for the key,
- 1077 n) Key security policy identifier,
- 1078 o) Key list (ACL),
- 1079 p) Key usage count,
- 1080 q) Parent key: This element could have two sub-elements:
 - 1081 i. Key identifier, and
 - 1082 ii. Nature of the relationship.
- 1083 r) Key sensitivity,
- 1084 s) Key protections: This element could have several sub-elements:
 - 1085 i. The mechanism used for integrity protection,
 - 1086 ii. The mechanism used for confidentiality protection
 - 1087 iii. The mechanism used for source authentication, and
 - 1088 iv. An indication of the protections that are enforced by a particular non-
 - 1089 cryptographic trusted process.
- 1090 t) Metadata protections: This element could have several sub-elements:
 - 1091 i. The mechanism used for integrity protection,
 - 1092 ii. The mechanism used for confidentiality protection,
 - 1093 iii. The mechanism used for source authentication, and
 - 1094 iv. An indication of the protections that are enforced by a particular non-
 - 1095 cryptographic trusted process.
- 1096 u) Trusted association protections: The following may need to be provided for each
- 1097 trusted association protection:
 - 1098 i. The mechanism used for integrity protection, and
 - 1099 ii. The mechanism used for source authentication.
- 1100 v) Date-Times:
 - 1101 i. The generation date,
 - 1102 ii. The association date,
 - 1103 iii. The activation date,
 - 1104 iv. The future activation date,
 - 1105 v. The renewal date,
 - 1106 vi. The future renewal data,
 - 1107 vii. The date of the last rekey,
 - 1108 viii. The future rekey date,
 - 1109 ix. The date of the last usage of the key,
 - 1110 x. The deactivation date,
 - 1111 xi. The future deactivation date,
 - 1112 xii. The expiration date,
 - 1113 xiii. The revocation date,
 - 1114 xiv. The compromise date,
 - 1115 xv. The destruction date, and
 - 1116 xvi. The future destruction date.
- 1117 w) Revocation Reason.
- 1118

1119 These metadata elements specify a key's important characteristics, its acceptable uses,
1120 and other information that is related to the key. This information is used by an FCKMS
1121 when managing and protecting the key. Metadata elements relevant to the management
1122 and use of a key should be correctly associated with a key and used whenever a key is
1123 stored, retrieved, loaded into a cryptographic module, used to protect data (e.g., other
1124 keys), exchanged with peer entities authorized to use the key, and when assuring that a
1125 key is correctly protected.

1126

1127 **FR:6.2** For each key type used in the system, the CKMS design **shall** specify all
1128 metadata elements selected for a trusted association, the circumstances under which the
1129 metadata elements are created and associated with the key, and the method of association
1130 (i.e., cryptographic mechanism or trusted process).

1131

1132 **FR:6.3** For each cryptographic mechanism used in the Key Protections metadata element
1133 (item s above), the CKMS design **shall** specify the following:

1134

i. The cryptographic algorithm: See item g) above.

1135

ii. The parameters for the key: See item i) above.

1136

iii. The key identifier: See item b) above.

1137

iv. The protection value: This element contains the protection value for integrity

1138

protection, confidentiality protection, or source authentication. For example, a

1139

properly implemented MAC or digital signature technique may provide for

1140

integrity protection and/or source authentication.

1141

v. When the protection was applied.

1142

vi. When the protection was verified.

1143 **FR:6.4** For each non-cryptographic trusted process used in the Key Protections metadata
1144 element (item s above), the CKMS design **shall** specify the following:

1145

i. The identifier of the process used to distinguish it from other processes, and

1146

ii. A description of the process or a pointer to a description of the process.

1147

1148 **FR:6.5** For each cryptographic mechanism used in the Metadata Protections metadata
1149 element (item t above), the CKMS design **shall** specify the following:

1150

i. The cryptographic algorithm.

1151

ii. The parameters for the key.

1152

iii. The key identifier.

1153

iv. The protection value (e.g., MAC, digital signature).

1154

v. When the protection was applied.

1155

vi. When the protection was verified.

1156

1157 Generally, the same mechanism will be used for the key and bound metadata, especially
1158 if the key and metadata are bundled together.

1159

1160 **FR:6.6** For each non-cryptographic trusted process used in the Metadata Protections
1161 metadata element (item t above), the CKMS design **shall** specify the following:

1162

i. The identifier that is used to distinguish this process from other processes, and

- 1163 ii. A description of the process or a pointer to a description of the process.
 1164
 1165 **FR:6.7** For each cryptographic mechanism used in the Trusted Association Protections
 1166 metadata element (item u above), the CKMS design **shall** specify the following:
 1167 i. The cryptographic algorithm,
 1168 ii. The parameters for the key,
 1169 iii. The key identifier,
 1170 iv. The protection value (e.g., MAC, digital signature),
 1171 v. When the protection was applied, and
 1172 vi. When the protection was verified.
 1173

- 1174 **FR:6.8** For each non-cryptographic trusted process used in the Trusted Association
 1175 Protections metadata element (item u above), the CKMS design **shall** specify the
 1176 following:
 1177 i. The identifier that is used to distinguish this process from other processes, and
 1178 ii. A description of the process or a pointer to a description of the process.
 1179

1180 **FR:6.9** The CKMS design **shall** specify the accuracy and precision required for dates and
 1181 times used by the system.
 1182

1183 **FR:6.10** The CKMS design **shall** specify what authoritative time sources are used to
 1184 achieve the required accuracy.
 1185

1186 **FR:6.11** The CKMS design **shall** specify how authoritative time sources are used to
 1187 achieve the required accuracy.
 1188

1189 **FR:6.12** The CKMS design **shall** specify which dates, times, and functions require a
 1190 trusted third-party time stamp.
 1191

PR:6.9		A Federal CKMS shall support all metadata elements that are specified in its CKMS design.
PR:6.10	SC-8 SC-11 SC-12 SC-28	A Federal CKMS shall physically or logically protect all sensitive metadata from unauthorized disclosure, use, and modification.
PR:6.11		A Federal CKMS shall support the protection of sensitive metadata at the same or a higher impact level than the impact level of the data to be protected by the associated key.
PR:6.12	SI-7	A Federal CKMS shall apply integrity protection to all metadata before transmission and storage, and verify the integrity of all metadata when received or before the initial use of the metadata.

PR:6.13		A Federal CKMS shall maintain the association between a key and its metadata.
PR:6.14	SC-8 SC-11 SC-12 SC-28	A Federal CKMS that protects Moderate or High impact-level information shall cryptographically protect sensitive metadata from unauthorized disclosure and modification when outside of a cryptographic module.
PR:6.15		A Federal CKMS shall use the NIST time source when access to a time source is required.
PR:6.16		A Federal CKMS that protects Moderate or High impact-level information shall support source authentication of the metadata elements for all cryptographic keys.

1192

PA:6.3		A Federal CKMS should explicitly support the following list of metadata elements: key label, key identifiers, key owner identifier(s), and the cryptographic algorithm using the key.
PA:6.4		A Federal CKMS that protects Low impact-level information should cryptographically protect sensitive metadata elements against unauthorized disclosure and modification when outside a cryptographic module.
PA:6.5		A Federal CKMS that protects Low impact-level information should provide source authentication of the metadata elements of all cryptographic keys.

1193 **6.2.2 Required Key and Metadata Information**

1194 Each key type requires certain metadata to be available when a key is used, whether the
 1195 information is explicitly recorded as metadata or is otherwise known by the FCKMS.

1196

1197 **FR:6.13** For each key type, the CKMS design **shall** specify the following information
 1198 regarding keys and metadata elements:

- 1199 a) The key type.
- 1200 b) The crypto period (for static keys).
- 1201 c) The method of generation.
 - 1202 i. The RNG used.
 - 1203 ii. A key generation specification (e.g., [FIPS 186] for signature keys, [SP 800-
 1204 56A] for Diffie-Hellman key establishment keys).
- 1205 d) For each metadata element, include
 - 1206 i. The source of the metadata, and
 - 1207 ii. How the metadata is vetted,
- 1208 e) The method of key establishment
 - 1209 i. The key transport scheme (if used),
 - 1210 ii. The key agreement scheme (if used), and
 - 1211 iii. The protocol name (if a named protocol is used).

- 1212 f) The disclosure protections (e.g., key confidentiality, physical security).
- 1213 g) The modification protections (e.g., a MAC or a digital signature).
- 1214 h) The applications that may use the key (e.g., TLS, EFS, S/MIME, IPsec, PKINIT,
- 1215 SSH, etc.).
- 1216 i) The applications that are not permitted to use the key.
- 1217 j) The key assurances:
 - 1218 i. Symmetric key assurances (e.g., format checks):
 - 1219 • Who obtains the assurance,
 - 1220 • The circumstances under which it is obtained, and
 - 1221 • How the assurance is obtained.
 - 1222 ii. Asymmetric key assurances (e.g., assurance of possession and validity):
 - 1223 • Who obtains the assurances,
 - 1224 • The circumstances under which the assurance is obtained, and
 - 1225 • How the assurance is obtained.
 - 1226 iii. Domain parameter validity checks:
 - 1227 • Who performs the validity check,
 - 1228 • The circumstances under which the checking is performed, and
 - 1229 • How the assurance of domain parameter validity was obtained.

1230
 1231 **FR:6.14** The CKMS design **shall** specify all syntax, semantics, and formats of all key
 1232 types and their metadata that will be created, stored, transmitted, processed, and
 1233 otherwise managed by the CKMS.

1234 **6.3 Key Lifecycle States and Transitions**

1235 A key may pass through several states between its generation and its destruction. For a
 1236 discussion of key states, see Section 7 of [NIST SP 800-57 Part 1]. A CKMS designer
 1237 will select and define the key states and transitions that will be supported by the FCKMS.

1238
 1239 **FR:6.15** The CKMS design **shall** specify all the states that the CKMS keys can attain.

1240
 1241 **FR:6.16** The CKMS design **shall** specify all transitions between the CKMS key states
 1242 and the data (inputs and outputs) involved in making the transitions.

1243

PR:6.17		A Federal CKMS shall support at least the following key lifecycle states and protect transitions among them: active, deactivated, revoked, and compromised.
----------------	--	--

1244

PA:6.6		A Federal CKMS should support the destroyed state.
---------------	--	---

1245

PF:6.1		A Federal CKMS could support the following key lifecycle states and verify the integrity and acceptability of transitions among them: pre-activated, suspended, and reactivated after a suspension.
---------------	--	--

1246 **6.4 Key and Metadata Management Functions**

1247 In an FCKMS, a user or an application can initiate key and metadata management
 1248 functions (sometimes called services). The functions themselves are performed entirely
 1249 within an FCKMS module, which contains a cryptographic module to perform the
 1250 cryptographic functions used by the FCKMS module. An Access Control System (ACS)
 1251 (see Section 6.7.1) should perform the authentication and authorization of an entity
 1252 initiating a key management service or cryptographic function.

1253
 1254 An FCKMS should provide for the creation, modification, replacement, and destruction
 1255 of keys and their metadata. Depending on the impact level, the input and/or output could
 1256 have integrity, source authentication, and/or confidentiality services applied to them.

1257
 1258 Parameters for a cryptographic function should be verified during input to an FCKMS
 1259 and a cryptographic module by verifying the protections (e.g., integrity codes) that have
 1260 been placed on the parameters.

1261
 1262 **FR:6.17** The CKMS design **shall** specify the key and metadata management functions to
 1263 be implemented and supported.

1264
 1265 **FR:6.18** The CKMS design **shall** identify the integrity, confidentiality, and source
 1266 authentication services that are applied to each key and metadata management function
 1267 parameter implemented in the CKMS.

1268

PR:6.18		A Federal CKMS shall support all key and metadata management functions that are required by the FCKMS Security Policy.
PR:6.19		A Federal CKMS shall provide integrity protection for a request and, upon receipt, shall verify the integrity of the request.

1269

PA:6.7		A Federal CKMS should support the following key and metadata management functions: generate a key, deactivate a key, register an owner, revoke a key, associate a key with its metadata, list key metadata, destroy a key and its metadata, establish a key, validate a key, recover a key and its metadata, and perform cryptographic functions using a key and its metadata.
---------------	--	---

PA:6.8		<p>A Federal CKMS should support the following for all user requests for key management services:</p> <ul style="list-style-type: none"> a) The authentication of the identity of the entity initiating the request, and b) A verification of the requestor’s authorization for receiving the service.
---------------	--	---

1270

PF:6.2		<p>A Federal CKMS could support integrity protection for the response to a user’s request for key management services.</p>
---------------	--	---

1271 **6.4.1 Generate a Key**

1272 When a user requires a key, and it is not automatically provided by an FCKMS, the user
 1273 should request that a key be generated by the FCKMS. The user may need to specify the
 1274 type of key and other necessary information (e.g., the name of the key-generation
 1275 technique), including some metadata that needs to be associated with the key when
 1276 requesting this function. The function may not return the newly generated key, but could,
 1277 for example, return a key identifier that points to the key and its associated metadata.

1278
 1279 Key-generation techniques typically depend on the cryptographic algorithm that will be
 1280 used with the key and the use of a random number generator. Different algorithms use
 1281 keys that have differing specifications (e.g., lengths and formats). Key generation for an
 1282 asymmetric algorithm results in the generation of a key pair, rather than a single key,
 1283 which is the case for symmetric-key algorithms. NIST has approved several random
 1284 number generators (see [SP 800-90A Rev1], [SP 800-90B], [SP 800-90C] and SP 800-
 1285 131A) and specifications for key generation (see [SP 800-133]).

1286
 1287 The key-generation function could provide, or require the input of, metadata that is to be
 1288 associated with the generated key.

1289
 1290 **FR:6.19** The CKMS design **shall** specify the key generation methods to be used in the
 1291 CKMS for each type of key.

1292
 1293 **FR:6.20** The CKMS design **shall** specify the underlying random number generators that
 1294 are used to generate symmetric and private keys.

1295

PR:6.20		<p>A Federal CKMS shall support and use NIST-approved methods for key generation.</p>
PR:6.21		<p>A Federal CKMS shall generate keys using a NIST-approved random number generator that provides a security strength that meets or exceeds the security strength required for the key.</p>

1296 **6.4.2 Register an Owner**

1297 The initial registration of a security entity (i.e., individual (person), organization, device
 1298 or process) and a cryptographic key with metadata is a fundamental requirement of every
 1299 FCKMS. This requirement is difficult to fully automate while preserving security (i.e.,
 1300 protecting from an impersonation threat), and thus, it usually requires verified and
 1301 authorized human interactions. There typically exists a registration process in an FCKMS
 1302 that associates each entity's initial set of long-term (i.e., static) secret, public, and/or
 1303 private keys with the entity's identifier and perhaps other metadata. The process of
 1304 associating a key owner's identifier, key, and metadata involves either an initial identity
 1305 authentication by a human relying on specific identification information, or relying on the
 1306 pre-existing identity of the owner in some FCKMS.

1307
 1308 **FR:6.21** The CKMS design **shall** specify all the processes involved in owner registration,
 1309 including the process for binding keys with the owner's identifier.

1310

PR:6.22	IA-4	During a registration process, a Federal CKMS shall register all security entities, and initial cryptographic keys and metadata.
PR:6.23	IA-4	A Federal CKMS shall : a) Support the initial registration and periodic verification of each security entity that is to be managed, b) Manage the association of each security entity with its key and its associated metadata, and c) Provide owner registration and key association processes that can be implemented and evaluated for all FCKMS entities.

1311 **6.4.3 Activate a Key**

1312 The activation function provides for the transition of a cryptographic key from the pre-
 1313 activation state to the active state (see [SP 800-57 Part 1] for further information). A key
 1314 could be automatically activated immediately after generation, upon request, or in
 1315 accordance with a date-time metadata value (e.g., set at the time of key generation) that
 1316 indicates when the key needs to become active and can be used.

1317

1318 **FR:6.22** The CKMS design **shall** specify how each key type is activated and the
 1319 circumstances for activating the key.

1320

1321 **FR:6.23** For each key type, the CKMS design **shall** specify requirements for the
 1322 notification of key activation, including which parties are notified, how they are notified,
 1323 what security services are applied to the notification, and the time-frames for
 1324 notification(s).

1325 **6.4.4 Deactivate a Key**

1326 This function transitions a key from an active state to a deactive state (see [SP 800-57
1327 Part 1] for further information). A cryptographic key is generally given a deactivation
1328 date and time when it is created and distributed. Deactivation may also be based on the
1329 number of times a key has been used or the amount of data that it has been used to
1330 protect. The period of time between activation and deactivation of a key is generally
1331 considered its lifetime or its cryptoperiod. This period usually has a maximum value,
1332 based in part on the impact levels of the data it is protecting and the threats that could be
1333 brought against that key or the entire FCKMS.

1334

1335 **FR:6.24** The CKMS design **shall** specify, for each key type, how deactivation of the key
1336 is determined (e.g., by crypto period, by number of uses, or by the amount of data).

1337

1338 **FR:6.25** The CKMS design **shall** specify how each key type is deactivated (e.g.,
1339 manually or automatically, based on the deactivation date-time, the number of usages, or
1340 the amount of protected data).

1341

1342 **FR:6.26** The CKMS design **shall** specify how the deactivation date-time for each key
1343 type can be changed.

1344

1345 **FR:6.27** For each key type, the CKMS design **shall** specify requirements for advance
1346 notification of the deactivation of the key type, including which CKMS supported roles
1347 are notified, how they are notified, what security services are applied to the notification,
1348 and the time-frames for notification(s).

1349

PR:6.24		A Federal CKMS shall support deactivating an active symmetric or private key and notifying relying parties that the key has been deactivated.
----------------	--	--

1350 **6.4.5 Revoke a Key**

1351 Key revocation should be used when the authorized use of a key must be terminated prior
1352 to the end of its cryptoperiod. A cryptographic key should be revoked as soon as feasible
1353 after its use is no longer authorized (e.g., the key has been compromised). Entities that
1354 have been, are, or will be using the key (i.e., relying parties) need to be notified that the
1355 key has been revoked; such notification includes both sending the notification to all
1356 relying parties and providing a notification that can be accessed by the relying parties,
1357 when needed. In this publication, revocation applies to both symmetric and asymmetric
1358 keys.

1359

1360 **FR:6.28** The CKMS design **shall** specify when, how, and under what circumstances
1361 revocation is performed and revocation information is made available to the relying
1362 parties.

1363

PR:6.25		A Federal CKMS shall support the revocation of a key and maintaining the reason for revocation.
PR:6.26		A Federal CKMS shall provide a notification when a key is revoked, including the reason for the revocation.

1364 **6.4.6 Suspend and Re-Activate a Key**

1365 A key may be temporarily suspended and later re-activated, i.e., suspension is a
 1366 temporary revocation of the key. While revocation is generally irreversible, suspension
 1367 can be reversed. Entities that may be using or relying on a key should be notified of both
 1368 the suspension and the re-activation of the key.

1369 Situations that may warrant suspension of a key, rather than irreversible revocation,
 1370 include: the unavailability of the owner for an extended period of time, a misuse of the
 1371 key, a possible compromise that is under investigation, and the misplacement of a token
 1372 containing the key.
 1373

1374 **FR:6.29** The CKMS design **shall** specify how, and under what circumstances, a key can
 1375 be suspended.
 1376

1377 **FR:6.30** The CKMS design **shall** specify how suspension information is made available
 1378 to the relying or communicating parties.
 1379

1380 **FR:6.31** The CKMS design **shall** specify how, and under what circumstances, a
 1381 suspended key is re-activated.
 1382

1383 **FR:6.32** The CKMS design **shall** specify how the suspended key is prevented from
 1384 performing security services.
 1385

1386 **FR:6.33** The CKMS design **shall** specify how re-activation information is made available
 1387 to the relying or communicating parties.
 1388

1389

PR:6.27		When a key is suspended, a Federal CKMS shall provide a notification to all relying parties, including the reason for the suspension.
PR:6.28		When a key is re-activated after a suspension, a Federal CKMS shall provide a notification to all relying parties.

1390

PF:6.3		A Federal CKMS could be capable of suspending and reactivating a key.
---------------	--	--

1391 **6.4.7 Renew a Public Key**

1392 Public key certificates contain the public key of an asymmetric key pair and a maximum
 1393 validity period for that certificate. It may be desirable to have a public key validity period

1394 that is shorter than the subject key’s cryptoperiod. Renewal establishes a new validity
 1395 period for an existing public key by issuing a new certificate containing the same public
 1396 key with a new validity period. The sum of the validity periods for the original certificate
 1397 and all renewed certificates for the same key must not exceed the cryptoperiod of the
 1398 private key.

1399
 1400 An FCKMS could notify the owner of a certificate when a certificate is about to expire so
 1401 that the key could be renewed prior to the end validity date on the certificate.

1402
 1403 **FR:6.34** The CKMS design **shall** specify how and the conditions under which a public
 1404 key can be renewed.

1405
 1406 **FR:6.35** For each key type, the CKMS design **shall** specify requirements for advance
 1407 notification of the key type renewal, including which parties are notified, how they are
 1408 notified, what security services are applied to the notification, and the time-frames for
 1409 notification(s).

1410

PR:6.29		A Federal CKMS shall not renew the validity period of a public key certificate beyond the maximum cryptoperiod of the private key that corresponds to the public key in the certificate.
----------------	--	---

1411

PF:6.4		A Federal CKMS could notify the owner of a public-key certificate that the certificate is about to expire.
PF:6.5		A Federal CKMS could provide notification to the relying parties of a public key that the public key has been renewed.

1412 **6.4.8 Key Derivation or Key Update**

1413 When a key is derived from other information (some of which is secret) in a non-
 1414 reversible manner, the process is called key derivation. Key update is a special case of
 1415 key derivation in which the secret information includes a key (K_1), and the derived key
 1416 (K_2) replaces K_1 . Key updating could result in a security exposure if an adversary obtains
 1417 a key and knows the update process used. Key update is not supported in this Profile.

1418
 1419 **FR:6.36** The CKMS design **shall** specify all processes used to derive or update keys and
 1420 the circumstances under which the keys are derived or updated.

1421
 1422 **FR:6.37** For each key type, the CKMS design **shall** specify requirements for advance
 1423 notification for deriving or updating the keys, including which parties are notified, how
 1424 they are notified, what security services are applied to the notification, and the time-
 1425 frames for notification(s).

1426

PR:6.30		A Federal CKMS shall not support key update.
----------------	--	---

PR:6.31		A Federal CKMS shall use only NIST-approved or allowed key derivation methods.
----------------	--	---

1427 **6.4.9 Destroy a Key and Metadata**

1428 A key and its metadata may be stored indefinitely in archive storage. When a key and its
 1429 sensitive metadata are no longer to be used, then all copies residing in operational
 1430 storage, backup storage, and within a cryptographic module must be destroyed. Non-
 1431 sensitive metadata may be retained for administrative purposes.

1432
 1433 **FR:6.38** The CKMS design **shall** specify how and the circumstances under which keys
 1434 are intentionally destroyed and whether the destruction is local to a component or
 1435 universal throughout the CKMS.

1436
 1437 **FR:6.39** For each key type, the CKMS design **shall** specify requirements for an advance
 1438 notification of key destruction, including which parties are notified, how they are
 1439 notified, what security services are applied to the notification, and the time-frames for
 1440 notification(s).

1441

PR:6.32		When a key and/or its sensitive metadata no longer needs to be used, a Federal CKMS shall destroy all copies of the key and/or its sensitive metadata residing in operational storage, backup storage, and within any cryptographic module.
PR:6.33	SC-12	When a Federal CKMS supports a destroyed state for keys, the Federal CKMS shall employ an approved key destruction method.
PR:6.34		When a Federal CKMS supports a destroyed state for sensitive metadata, the Federal CKMS shall employ an approved metadata destruction method.

1442

PF:6.6		Within one hour of the destruction of a key and/or its associated metadata, a Federal CKMS could notify all relying parties of the destruction using a mechanism that provides integrity protection and source authentication.
---------------	--	---

1443 **6.4.10 Associate a Key with its Metadata**

1444 A cryptographic key could have several metadata elements associated with it. The CKMS
 1445 designer determines which metadata are to be associated with a key and selects the
 1446 protection mechanism(s) that provide(s) the association. Depending on the sensitivity of a
 1447 metadata element, the metadata element could require confidentiality protection, integrity
 1448 protection, and source authentication. The association function uses cryptography or a
 1449 trusted process to provide these protections.

1450

1451 **FR:6.40** For each key type used, the CKMS design **shall** specify what metadata is
 1452 associated with the key, how the metadata is associated with the key, and the
 1453 circumstances under which metadata is associated with the key.

1454
 1455 **FR:6.41** For each key type used, the CKMS design **shall** describe how the following
 1456 security services (protections) are applied to the associated metadata: source
 1457 authentication, integrity, and confidentiality.
 1458

PR:6.35		A Federal CKMS shall : a) Create a trusted association between a key and its metadata upon their entry to the FCKMS, b) Maintain the trusted association throughout the key lifetime, and c) Establish a new trusted association following modification or replacement of any metadata.
PR:6.36		A Federal CKMS that protects Moderate or High impact-level information shall cryptographically bind a key and its metadata elements.

1459

PA:6.9		A Federal CKMS that protects Low impact-level information should cryptographically bind a key and its metadata elements.
---------------	--	---

1460 **6.4.11 Modify Metadata**

1461 The modify metadata function can be used to modify existing metadata that is associated
 1462 with a key. Some metadata elements for a key type may be fixed after creation and not
 1463 modifiable; other metadata elements may be modified by some entities, but not by others.
 1464 Unauthorized modification of metadata that are associated with a key by an unauthorized
 1465 entity must be prevented, and attempts should be detected and reported.

1466
 1467 **FR:6.42** The CKMS design **shall** specify the circumstances under which associated
 1468 metadata is modified.
 1469

PR:6.37		A Federal CKMS shall designate which metadata elements are modifiable by authorized entities and which metadata elements cannot be modified after initial creation.
PR:6.38	AC-3	A Federal CKMS shall prevent the modification of metadata except by authorized entities.

1470

PA:6.10		A Federal CKMS should report the attempted modification of metadata by unauthorized entities to the system administrator.
----------------	--	--

1471 **6.4.12 Delete Metadata**

1472 This function deletes metadata associated with a key. A deletion of the metadata requires
 1473 the authentication of the requestor and verification of his/her authorization. Metadata
 1474 elements may be deleted as an entire group, as an individual element, or as a specific
 1475 subset of the elements.

1476
 1477 **FR:6.43** The CKMS design **shall** specify the circumstances under which the metadata
 1478 associated with a key is deleted.

1479
 1480 **FR:6.44** The CKMS design **shall** specify the technique used to delete associated
 1481 metadata.

1482

PR:6.39	AC-3	A Federal CKMS shall allow metadata destruction only by authenticated and authorized entities.
PR:6.40		A Federal CKMS shall support the selection of which metadata elements can be destroyed and the designation of who is authorized to perform the destruction.

1483 **6.4.13 List Key Metadata**

1484 This function allows an authorized entity to list one or more metadata elements of a key.
 1485 The authorization of an entity to use a key does not automatically authorize that entity to
 1486 list the key’s metadata elements. Each metadata element could be assigned with a
 1487 different set of permissions (e.g., some metadata elements could be prohibited from being
 1488 listed at all), others could be listed by any user, while still others could be listed by only
 1489 persons assuming an administrator role.

1490
 1491 **FR:6.45** For each key type, the CKMS design **shall** specify which metadata can be listed
 1492 by authorized entities.

1493

PR:6.41		A Federal CKMS shall provide metadata elements only to those entities authenticated and authorized for access to them.
----------------	--	---

1494 **6.4.14 Store Operational Key and Metadata**

1495 Operational key and metadata storage involves placing a key and/or metadata in storage
 1496 outside of a cryptographic module for use during the key’s cryptoperiod without retaining
 1497 the original copy in the cryptographic module. Keys and metadata must be physically or
 1498 cryptographically protected when in storage (see the requirements specified in Section
 1499 6.1.2, Section 6.2.1, and [SP 800-57 Part 1]).

1500
 1501 **FR:6.46** For each key type, the CKMS design **shall** specify: the circumstances under
 1502 which keys of each type and their metadata are stored, where the keys and metadata are
 1503 stored, and how the keys and metadata are protected.

1504 **6.4.15 Backup of a Key and its Metadata**

1505 The backup of keys and metadata involves copying the keys and/or metadata to a separate
 1506 medium than is used for the operational storage of keys and from which the keys can be
 1507 recovered if the original (operational) copy is lost, modified, or otherwise becomes
 1508 unavailable. The FCKMS, the owner, or a trusted entity could back up keys and
 1509 metadata.

1510
 1511 **FR:6.47** The CKMS design **shall** specify how, where, and the circumstances under
 1512 which keys and their metadata are backed up.

1513
 1514 **FR:6.48** The CKMS design **shall** specify the security policy for the protection of backed-
 1515 up keys/metadata.

1516
 1517 **FR:6.49** The CKMS design **shall** specify how the security policy is implemented during
 1518 the key and metadata back up, e.g., how the confidentiality and multiparty control
 1519 requirements are implemented during transport and storage of the backed-up keys and
 1520 metadata.

1521

PR:6.42	CP-6 CP-9	A Federal CKMS shall backup long-term keys and metadata on a medium that is separate from that used for the operational storage of the keys and metadata.
PR:6.43	SC-28	A Federal CKMS shall provide backed up keys and metadata with the same integrity and confidentiality protections as the operational copies of the keys and metadata and at the same or higher security strength.

1522

1523 **6.4.16 Archive Key and/or Metadata**

1524 Key and/or metadata archiving involves placing a copy of a key and/or metadata in a safe
 1525 storage facility so that they can be recovered if and when needed. Key and/or metadata
 1526 archiving includes provisions for moving the key and/or metadata to a new storage
 1527 medium before the old medium is replaced or becomes unreadable.

1528
 1529 An archive should support the FCKMS Security Policy (see Section 4.3) in archive
 1530 facilities and when moving keys and metadata to and from an archive. Archived keys
 1531 and/or metadata must be physically or cryptographically protected. Keys used to protect
 1532 archived keys and/or metadata will have cryptoperiods, and must be replaced when their
 1533 cryptoperiods expire. Changing an archive key may involve changing to a stronger
 1534 cryptographic algorithm and archive key, and re-encryption of the archived keys and/or
 1535 metadata under the new archive key and algorithm.

1536
 1537 Maintaining a key and metadata archive could require moving archived keys and/or
 1538 metadata to new storage media when the old media are no longer readable because of the
 1539 aging of, or technical changes to, the media and media readers. When the archived keys

1540 and/or metadata have been transferred to a new storage medium, the copies on the old
 1541 storage medium must be destroyed (see [SP 800-88]).

1542
 1543 **FR:6.50** The CKMS design **shall** specify how, where, and the circumstances under
 1544 which keys and/or their metadata are archived.

1545
 1546 **FR:6.51** The CKMS design **shall** specify the technique for the secure destruction of the
 1547 key and/or metadata or the secure destruction of the old storage medium after being
 1548 written onto a new storage medium.

1549
 1550 **FR:6.52** The CKMS design **shall** specify how keys and/or their metadata are protected
 1551 after the cryptoperiod of an archive key expires.

1552

PR:6.44	SC-28	When keys and metadata are archived, a Federal CKMS shall provide them with the same integrity and confidentiality protections as the operational copies of the keys and metadata and at the same or a higher security strength.
PR:6.45	SI-12	When keys and metadata are archived, a Federal CKMS shall archive keys and metadata in accordance with applicable laws, regulations, and policies.
PR:6.46		When archived keys and metadata are moved to a new medium, a Federal CKMS shall destroy the copies of keys and metadata on the old storage medium using approved methods.

1553

PA:6.11		A Federal CKMS should archive long-term keys and metadata in accordance with [SP 800-57 Part 1].
PA:6.12		A Federal CKMS should move archived keys and metadata to an alternate readable storage medium before the old medium is replaced or becomes unreadable.

1554 **6.4.17 Recover a Key and/or Metadata**

1555 Key and/or metadata recovery involves obtaining a copy of a key and/or its metadata that
 1556 have been previously backed up, or archived. The key and/or metadata must be recovered
 1557 by an authorized entity (e.g., its owner or a key-recovery agent) following the rules for
 1558 recovery stated in the FCKMS Security Policy and in accordance with Section 6.1.2 and
 1559 Section 6.2.1.

1560
 1561 **FR:6.53** The CKMS design **shall** specify the CKMS recovery policy for keys and/or
 1562 metadata.

1563
 1564 **FR:6.54** The CKMS design **shall** specify the mechanisms used to implement and enforce
 1565 the recovery policy for keys and/or metadata.

1566
1567
1568
1569
1570
1571
1572

FR:6.55 The CKMS design **shall** specify how, and the circumstances under which, keys and/or metadata are recovered from each key database or metadata storage facility.

FR:6.56 The CKMS design **shall** specify how keys and/or metadata are protected during recovery.

PR:6.47		A Federal CKMS shall support recovering keys and/or metadata that have been backed up or archived, following the FCKMS rules for recovery.

1580
1581

6.4.18 Establish a Key

Key establishment is the process by which a key is securely shared between two or more entities. The key may be transported from one entity to another (key transport), or the key may be derived from a shared secret generated by the entities (key agreement). The method of transporting or sharing keys may be either manual (e.g., sent by a courier) or automated (e.g., sent over the Internet).

FR:6.57 The CKMS design **shall** specify how, and the circumstances under which, keys and their metadata are established.

1582

6.4.19 Enter a Key and Associated Metadata into a Cryptographic Module

1583
1584
1585
1586
1587
1588
1589
1590
1591
1592
1593
1594
1595
1596

The key-entry function of a cryptographic module is used to enter one or more keys and associated metadata into the module in preparation for use by the module. Section 2.10 above requires the use of FIPS-140-validated cryptographic modules and relates the impact levels of data requiring protection to [FIPS 140] security levels.

A trusted channel is a secure communication link between the cryptographic module and a sender or receiver to securely communicate unprotected plaintext critical security parameters, key components and authentication data. A trusted channel protects against eavesdropping, as well as physical or logical tampering by unwanted operators/entities, processes or other devices, between the module’s defined input or output ports and along the communication link between the sender or receiver endpoints. Identity-based authentication is required when a trusted channel is used, which may require multi-factor authentication.

1597
1598
1599
1600
1601
1602
1603
1604
1605

The communication link is cryptographically established between the cryptographic module and the module of the remote operator or remote cryptographic entity, generally for the transport of keys and sensitive metadata. A trusted channel exhibits a verification component that the operator or a module may use to confirm that the trusted channel has been established, will not allow man-in-the-middle or replay types of attacks, and is intended to cryptographically protect the transported keys and sensitive metadata during entry and output. The trusted channel must use only NIST-approved or NIST-allowed security functions to establish the channel and transfer data.

1606 If a cryptographic module does not employ a trusted channel, then the Federal CKMS
 1607 should establish a trusted channel before keys and sensitive metadata are entered into the
 1608 control of the Federal CKMS module⁶.

1609
 1610 **FR:6.58** The CKMS design **shall** specify how, and the circumstances under which, keys
 1611 and metadata are entered into a cryptographic module, the form in which they are
 1612 entered, and the method used for entry.

1613
 1614 **FR:6.59** The CKMS design **shall** specify how the integrity and confidentiality (if
 1615 necessary) of the entered keys and metadata are protected and verified upon entry.
 1616

PR:6.48		A Federal CKMS shall enter keys into cryptographic modules in accordance with the requirements in [FIPS 140] and the impact levels associated with the keys.
PR:6.49		A Federal CKMS shall enter sensitive metadata into cryptographic modules in accordance with the [FIPS 140] requirements for the entry of sensitive security parameters. Thus, the cryptographic module treats sensitive metadata in the same manner as it treats sensitive security parameters.

1617

PA:6.13		A Federal CKMS should enter keys and sensitive metadata into cryptographic modules by means of a trusted channel.
PA:6.14		If a cryptographic module does not employ a trusted channel, then the Federal CKMS should establish a trusted channel before keys and sensitive metadata are entered into the control of the Federal CKMS module, using identity-based authentication.

1618 **6.4.20 Output a Key and Associated Metadata from a Cryptographic Module**

1619 The key-output function of a cryptographic module outputs one or more keys and their
 1620 associated metadata from the module. The output of keys and metadata could be needed
 1621 in order to store (outside the cryptographic module), transfer, back up, or archive them. A
 1622 cryptographic module that serves as a key generation facility for other FCKMS modules
 1623 would output keys prior to distribution.

1624 As with key entry, a trusted channel is recommended for key and sensitive data output. If
 1625 a cryptographic module does not employ a trusted channel, then the Federal CKMS
 1626 should establish a trusted channel before outputting keys and sensitive metadata beyond
 1627 the control of the Federal CKMS module.
 1628

⁶ It is anticipated that future versions of [FIPS 140] will require a trusted channel at security levels 3 and 4.

1629 **FR:6.60** The CKMS design **shall** specify how, and the circumstances under which, keys
 1630 and metadata can be output from a cryptographic module and the form in which they are
 1631 output.

1632
 1633 **FR: 6.61** The CKMS design **shall** specify how the confidentiality and integrity of the
 1634 output keys and metadata are protected while outside of a cryptographic module.

1635
 1636 **FR:6.62** If a private key, symmetric key, or confidential metadata is output from the
 1637 cryptographic module in plaintext form, the CKMS design **shall** specify if and how the
 1638 calling entity is authenticated before the key and metadata are provided.

1639

PR:6.50		A Federal CKMS shall output keys from cryptographic modules in accordance with the requirements in [FIPS 140] and the impact levels associated with the keys.
PR:6.51		A Federal CKMS shall output sensitive metadata from cryptographic modules in accordance with the [FIPS 140] requirements for output of sensitive security parameters. Thus, the cryptographic module treats sensitive metadata in the same manner as it treats sensitive security parameters.

1640

PA:6.15		A Federal CKMS should output keys and sensitive metadata from cryptographic modules by means of a trusted channel.
PA:6.16		If a cryptographic module does not employ a trusted channel, then the Federal CKMS should establish a trusted channel before outputting keys and sensitive metadata beyond the control of the Federal CKMS module.

1641 **6.4.21 Validate Public-Key Domain Parameters**

1642 This function performs certain validity checks on the public domain parameters of some
 1643 public-key algorithms (e.g., Diffie-Hellman key establishment and ECDSA).

1644
 1645 **FR:6.63** The CKMS design **shall** specify how, where, and the circumstances under
 1646 which, public-key domain parameters are validated.

1647

PR:6.52		For applicable public-key algorithms, a Federal CKMS shall validate a public key's domain parameters as specified in [SP 800-56A] and [SP 800-89] before using them.
----------------	--	---

1648 **6.4.22 Validate a Public Key**

1649 This function performs certain validity checks on a public key to provide some assurance
 1650 that it is arithmetically correct.

1651

1652 **FR:6.64** The CKMS design **shall** specify how, where, and the circumstances under
 1653 which, public keys are validated.
 1654

PR:6.53		A Federal CKMS shall validate public keys as specified in [SP 800-56A], [SP 800-56B] and [SP 800-89] before using them.
----------------	--	--

1655 **6.4.23 Validate a Public Key Certification Path**

1656 This function validates the certification path (also known as a certificate chain) from the
 1657 trust anchor⁷ of the relying entity to a public key in which the relying entity needs to
 1658 establish trust (i.e., the public key of the other entity in a transaction). Validation of the
 1659 certification path provides assurance that the identity of the originating entity, as
 1660 specified in the certificate, is the owner of the public key in the certificate and is the
 1661 holder of the corresponding private key. The latter assumes that a trusted certificate
 1662 authority obtained proof of private-key possession.

1663 **FR:6.65** The CKMS design **shall** specify how, where, and the circumstances under
 1664 which, a key certification path is validated.
 1665
 1666

PR:6.54	IA-5 (2)	A Federal CKMS shall validate the certification path of a public key prior to using the public key in the certificate.
----------------	----------	---

1667 **6.4.24 Validate a Symmetric Key**

1668 This function performs tests on a symmetric key to validate its integrity, such as verifying
 1669 that the length and format are correct. The function could also verify any error
 1670 detection/correction codes or integrity checks placed upon the key and/or its metadata.

1671 **FR:6.66** The CKMS design **shall** specify how, where, and the circumstances under
 1672 which symmetric keys and/or metadata are validated.
 1673
 1674

PR:6.55		A Federal CKMS shall validate a symmetric key before its initial use.
----------------	--	--

1675 **6.4.25 Validate a Private Key (or Key Pair)**

1676 This function performs tests on private keys or key pairs to verify that they meet their
 1677 specifications. Only the private-key owner or a trusted third party acting on behalf of the
 1678 private-key owner can perform this test.

1679 **FR:6.67** The CKMS design **shall** specify how, where and the circumstances under
 1680 which, private keys or key pairs and/or metadata can be validated
 1681
 1682

⁷ A trust anchor is a trusted public key that is usually cached locally in a trust-anchor store. Also discussed in Section 6.4.28.

PR:6.56		A Federal CKMS shall validate private keys or key pairs as specified in [SP 800-56A] or [SP 800-56B] before their first use.
----------------	--	---

1683 **6.4.26 Validate the Possession of a Private Key**

1684 This function is used by an entity that receives a public key and needs assurance that the
 1685 claimed owner of the public key has possession of the corresponding private key. This
 1686 function could also validate that a private-key owner actually possesses his/her own
 1687 private-key.

1688
 1689 **FR:6.68** The CKMS design **shall** specify how, where, and the circumstances under
 1690 which, possession of private keys and their metadata are validated.

1691

PR:6.57		A Federal CKMS shall obtain assurance of private-key possession by the key's owner, as specified in [SP 800-56A], [SP 800-56B] and [SP 800-89] before its first use.
----------------	--	---

1692 **6.4.27 Perform a Cryptographic Function using the Key**

1693 Cryptographic functions using keys are performed in a cryptographic module to
 1694 cryptographically protect all data, including metadata and other keys and process already
 1695 protected information. These functions may include signature generation, signature
 1696 verification, data encryption, ciphertext decryption, key wrapping, key unwrapping,
 1697 MAC generation, and MAC verification.

1698
 1699 **FR:6.69** The CKMS design **shall** specify all cryptographic functions that are supported
 1700 and where they are performed in the CKMS (e.g., CA, host, or end user system).

1701 **6.4.28 Manage the Trust Anchor Store**

1702 An FCKMS could require that some entities have one or more trusted public keys, called
 1703 "trust anchors." Trust anchors are cached in a trust anchor store. A trust anchor can
 1704 establish trust in other public keys that might not otherwise be trusted. Therefore, the
 1705 integrity of trust anchors is critical to the security of the FCKMS. The FCKMS typically
 1706 supports trust-anchor management functions, such as adding, deleting and storing trust
 1707 anchors.

1708

1709 Many commonly used products, such as browsers, are delivered and initially installed
 1710 with an assortment of trust anchors, not all of which merit trust.

1711

1712 **FR:6.70** The CKMS design **shall** specify all trust anchor management functions that are
 1713 supported (see RFC 6024).

1714

1715 **FR:6.71** The CKMS design **shall** specify how the trust anchors are securely distributed
 1716 so that the relying parties can perform source authentication and integrity verification on
 1717 those trust anchors.

1718
1719
1720
1721
1722

FR:6.72 The CKMS design **shall** specify how the trust anchors are managed in relying-entity systems to ensure that only authorized additions, modifications, and deletions are made to the relying-entity system’s trust anchor store.

PR:6.58	SC-12	A Federal CKMS shall only use trust anchors that meet the following conditions: <ul style="list-style-type: none"> a) The organization associated with the trust anchor is trusted, b) The security policy associated with the trust anchor is acceptable, c) The actual source of the trust anchor has been authenticated, and d) The integrity of the trust anchor has been verified.
PR:6.59		Only authorized additions, modifications, and deletions shall be made to trust anchors within an FCKMS.

1723

PA:6.17		A Federal CKMS should use trust anchor formats as specified in [RFC 5914] or its revisions.

6.5 Cryptographic Key and/or Metadata Security: In Storage

Cryptographic keys are typically stored with their metadata. An FCKMS should verify the authorization of the submitting entity and the integrity of the submitted key and metadata before they are stored. See Section 6.5 of the Framework for further discussion.

An FCKMS should only allow authorized users to have access to stored keys. Thus, an Access Control System (ACS) (see Section 6.7.1) should protect stored keys and metadata.

FR:6.73 The CKMS design **shall** specify the methods used to authenticate the identity and verify the authorization of the entity submitting keys and/or metadata for storage.

FR:6.74 The CKMS design **shall** specify the methods used to verify the integrity of keys and/or metadata submitted for storage.

FR:6.75 The CKMS design **shall** specify the methods used to protect the confidentiality of symmetric and private stored keys and metadata.

FR:6.76 If a key-wrapping key (or key pair) is used to protect stored keys, then the CKMS design **shall** specify the methods used to protect the key-wrapping key (or key pair) and control its use.

1746 **FR:6.77** The CKMS design **shall** specify the methods used to protect the integrity of
 1747 stored keys and metadata.

1748

1749 **FR:6.78** The CKMS design **shall** specify how access to stored keys is controlled.

1750

1751 **FR:6.79** The CKMS design **shall** specify the techniques used for correcting or recovering
 1752 all stored keys.

1753

PR:6.60		Before keys and metadata are stored, a Federal CKMS shall verify the authorization of the entity submitting keys and/or metadata for storage, and verify the integrity of the keys and metadata.
PR:6.61	AC-3	Only authorized entities shall be allowed access to stored keys and metadata in a Federal CKMS.

1754 **6.6 Cryptographic Key and Metadata Security: During Key Establishment**

1755 Keys and metadata can be established between entities needing to communicate securely
 1756 using key transport or key agreement methods. These methods are typically used to
 1757 establish keys over electronic communications networks, but some of these could also be
 1758 used to provide extra security (i.e., beyond physical protection) when keys are manually
 1759 distributed. [SP 800-56A] and [SP 800-56B] specify cryptographic schemes for
 1760 automated key establishment. **PR:2.2** in Section 2.2 requires the use of NIST-approved
 1761 key-establishment schemes for automated key establishment.

1762 **6.6.1 Key Transport**

1763 When symmetric or private cryptographic keys and sensitive metadata are transported
 1764 (distributed) from one entity (the sender) to one or more other entities (the intended
 1765 receiver(s)), they must be protected. Symmetric keys and private keys require
 1766 confidentiality protection, and all keys require integrity protection. A trusted courier can
 1767 physically protect a manually transported key, while automated electronic-based transport
 1768 must be protected using cryptography. NIST-approved methods for automated key
 1769 transport are provided in [SP 800-56A] and [SP 800-56B].

1770

1771 The receiver of a transported key typically needs assurance that the key came from the
 1772 expected, authorized key sender. When transported using automated methods, this
 1773 assurance may be provided by a cryptographic mechanism (which is part of the complete
 1774 key establishment protocol) that authenticates the identity of the sender to the receiver;
 1775 the FCKMS should verify the sender's authority to perform the transport. When a key is
 1776 transported manually, authenticating the identity of the courier, and verifying the
 1777 courier's authorization to transport the key should provide this assurance.

1778

1779 **FR:6.80** The CKMS design **shall** specify the methods used to protect the confidentiality
 1780 of symmetric and private keys during their transport.

1781

1782 **FR:6.81** The CKMS design **shall** specify the methods used to protect the integrity of
 1783 transported keys and how the keys can be reconstructed or replaced after detecting errors.

1784

1785 **FR:6.82** The CKMS design **shall** specify how the identity of the key sender is
 1786 authenticated to the receiver of transported keying material.

1787

PR:6.62		When keys and metadata are received using a key-transport scheme, a Federal CKMS shall support mechanisms to verify: <ul style="list-style-type: none"> a) The authorization of the source, b) The integrity of the received data, and c) That confidentiality has been provided to secret and private keys and sensitive metadata.
----------------	--	---

1788 **6.6.2 Key Agreement**

1789 Two entities working together can create and agree on a cryptographic key without the
 1790 key being transported from one entity to the other during an automated key-agreement
 1791 process. Cryptographic algorithms employing key-agreement keys are used by each
 1792 entity. NIST-approved methods for key agreement using public-key algorithms are
 1793 provided in [SP 800-56A] and [SP 800-56B].

1794

1795 Each entity participating in a key-agreement process should obtain assurance of the
 1796 identity of the other entity during the execution of that process.

1797

1798 **FR:6.83** The CKMS design **shall** specify each key agreement scheme supported by the
 1799 CKMS.

1800

1801 **FR:6.84** The CKMS design **shall** specify how each entity participating in a key
 1802 agreement is authenticated.

1803

PR:6.63		When keys and metadata are agreed-upon during an automated key-agreement process, a Federal CKMS shall obtain assurance of the identity of each party involved in the transaction.
----------------	--	---

1804 **6.6.3 Key Confirmation**

1805 When keys are established between two entities, each entity should confirm that the other
 1806 entity did, in fact, establish the correct key. [SP 800-56A] and [SP 800-56B] specify key
 1807 confirmation schemes for use in some automated key-establishment schemes. Other
 1808 methods may also be appropriate, such as decrypting ciphertext and comparing with the
 1809 expected plaintext value.

1810

1811 **FR:6.85** The CKMS design **shall** specify each key confirmation method used to confirm
 1812 that the correct key was established with the other entity.

1813
1814
1815
1816

FR:6.86 The CKMS design **shall** specify the circumstances under which each key confirmation is performed.

PR:6.64		For Moderate and High impact-level systems, a Federal CKMS shall support key confirmation for all key-establishment transactions.
PA:6.18		For Low impact-level systems, a Federal CKMS should support key confirmation for all key-establishment transactions.

1817

6.6.4 Key Establishment Protocols

1818
1819
1820
1821

Several protocols have been developed for the establishment of cryptographic keys. Often, these protocols are designed for a particular application or set of applications (e.g., secure email or secure data file transfer).

1822
1823
1824
1825

A high-level overview of several key-establishment protocols can be found in [SP 800-57 Part 3 Rev 1], along with guidance as to which cryptographic options are recommended for U.S. Government use. In this document (i.e., SP 800-152), these protocols are referred to as NIST-allowed key-establishment protocols.

1826
1827
1828
1829

FR:6.87 The CKMS design **shall** specify all the protocols that are employed by the CKMS for key establishment and storage purposes.

PR:6.65		When key establishment is required, a Federal CKMS shall use a NIST-allowed key-establishment protocol.
----------------	--	--

1830

6.7 Restricting Access to Key and Metadata Management Functions

1831
1832
1833
1834

Access to an FCKMS’s key and metadata management functions should be supported for authorized entities and controlled to prevent unauthorized access to keys and metadata. An entity requesting an FCKMS service or initiating a cryptographic function should be authenticated, and that entity’s authorization should be verified.

1835

6.7.1 The Access Control System (ACS)

1836
1837
1838
1839
1840
1841

An access control system is needed by an FCKMS to assure that every key and metadata management function can only be initiated by the FCKMS itself or in response to a request by an authorized entity. When key-management functions are initiated by an entity, an access control system should assure that the initiator is authenticated, performing only the requested functions that are authorized, and that all applicable constraints are satisfied. See Section 6.7.1 of the Framework for additional discussion.

1842
1843
1844
1845

FR:6.88 The CKMS design **shall** specify the topology of the CKMS by indicating the locations of the entities, the ACS, the function logic, and the connections between them.

1846 **FR:6.89** The CKMS design **shall** specify the constraints on the key management
 1847 functions that are implemented to assure proper operation.

1848
 1849 **FR:6.90** The CKMS design **shall** specify how access to the key management functions is
 1850 restricted to authorized entities.

1851
 1852 **FR:6.91** The CKMS design **shall** specify the ACS and its policy for controlling access to
 1853 key management functions.

1854
 1855 **FR:6.92** The CKMS design **shall** specify at a minimum:

- 1856 a) The granularity of the entities (e.g., person, device, organization),
- 1857 b) If and how entities are identified,
- 1858 c) If and how entities are authenticated,
- 1859 d) If and how the entity authorizations are verified, and
- 1860 e) The access control on each key management function.

1861
 1862 **FR:6.93** The CKMS design **shall** specify the capabilities of its ACS to accommodate,
 1863 implement, and enforce the CKMS Security Policy.

1864

PR:6.66	AC-3 AC-24	A Federal CKMS shall control access to, and the initiation of, all its key and metadata management services and functions, granting access to and permission to initiate a requested service or function only after verifying the authorization of the requesting entity to perform the requested service or function.
----------------	---------------	---

1865 **6.7.2 Restricting Cryptographic Module Entry and Output of Plaintext Keys**

1866 An FCKMS should minimize human access to plaintext keys. The primary need for keys
 1867 to be in plaintext is when they are performing cryptographic functions within a
 1868 cryptographic module. A cryptographic module should provide physical protection and
 1869 control physical access to the plaintext keys so that they cannot be replaced or disclosed
 1870 while in the cryptographic module. Therefore, a major concern is the entry and output of
 1871 plaintext secret and private keys into/from the cryptographic module.

1872
 1873 Note that Section 6.4.19 addresses the entry of keys and metadata into a cryptographic
 1874 module, and Section 6.4.20 addresses the output from the module.

1875
 1876 **FR:6.94** The CKMS design **shall** specify the circumstances under which plaintext secret
 1877 or plaintext private keys are entered into or output from a cryptographic module.

1878

1879 **FR:6.95** If plaintext secret or plaintext private keys are entered into or output from any
 1880 cryptographic module, then the CKMS design **shall** specify how the plaintext keys are
 1881 protected and controlled outside of the cryptographic module.

1882
 1883 **FR:6.96** If plaintext secret or plaintext private keys are entered into or output from any
 1884 cryptographic module, then the CKMS design **shall** specify how such actions are audited.
 1885

PR:6.67	AU-2 AU-12	When plaintext keys are entered into or output from a cryptographic module, a Federal CKMS shall be capable of auditing the entry and output process.
----------------	---------------	--

1886 **6.7.3 Controlling Human Input**

1887 If a key-management function requires that a human input a key or sensitive metadata,
 1888 the human must accept responsibility for the accuracy and security of the input, as well as
 1889 entering the input at the proper time or when the proper event occurs. The FCKMS-
 1890 initiated and controlled input and output of keys and/or sensitive metadata could be
 1891 transparent to a user and possibly more secure.

1892
 1893 **FR:6.97** For each key and metadata management function, the CKMS design **shall**
 1894 specify all human input parameters, their formats, and the actions to be taken by the
 1895 CKMS if they are not provided.
 1896

PA:6.19		A Federal CKMS should minimize human involvement in entering and outputting keys and sensitive metadata to/from the FCKMS.
----------------	--	---

1897 **6.7.4 Multiparty Control**

1898 Certain FCKMS key-management functions could require multiparty control. Requiring k
 1899 of n entities to be authenticated to and authorized by the FCKMS access-control system
 1900 before the function is performed could provide multiparty control. Multiparty controls
 1901 should be used when performing key-management functions for highly sensitive
 1902 applications.

1903
 1904 Of particular concern are the keys used by a Certificate Authority to sign certificates and
 1905 any master keys used by the FCKMS for self-protection (e.g., the keys used to access
 1906 other keys within the FCKMS, such as the keys used to protect a database of keys).

1907
 1908 **FR:6.98** The CKMS design **shall** specify all functions that require multiparty control,
 1909 specifying k and n for each function.

1910
 1911 **FR: 6.99** For each multiparty function, the CKMS design **shall** cite or specify any known
 1912 rationale (logic, mathematics) as to why any k of the n entities can enable the desired
 1913 function, but $k-1$ of the entities cannot.
 1914

PR:6.68	AC-3 (2)	A Federal CKMS shall support multiparty control for managing and using Certificate Authority keys in High impact-level systems.
----------------	----------	--

1915

PA:6.20	AC-3 (2)	A Federal CKMS should use multiparty control for managing and using Certificate Authority keys in Low and Moderate impact-level systems.
----------------	----------	---

PA:6.21	AC-3	A Federal CKMS should use multiparty control for Security Domain Authority functions.
----------------	------	--

1916

6.7.5 Key Splitting

1917

Key splitting should be used when multiparty control is used. When a highly sensitive key is required, n key splits should be generated so that any k of the key splits can be used to form the key, but having any $k-1$ key splits provides no knowledge about the key.

1918

1919

1920

1921

FR: 6.100 The CKMS design **shall** specify all keys that are managed using key splitting techniques and **shall** specify n and k for each technique.

1922

1923

1924

FR: 6.101 For each (n, k) key splitting technique used, the CKMS design **shall** specify how key splitting is done, and any known rationale (logic, mathematics) as to why any k of the n key splits can form the key, but $k-1$ of the key splits provide no information about the key.

1925

1926

1927

1928

PF:6.7		A Federal CKMS could use key splitting in order to implement multiparty control.
---------------	--	---

1929

6.8 Compromise Recovery

1930

A compromise is the unauthorized disclosure, modification, substitution, or use of sensitive data (e.g., keys, metadata, or other security-related information) or the unauthorized modification of a security-related system, device or process in order to gain unauthorized access. An FCKMS should protect all keys and sensitive metadata so that they are not disclosed, modified, substituted or used by unauthorized parties. This requires that all components in the FCKMS remain secure.

1931

1932

1933

1934

1935

1936

1937

However, since it is difficult to prevent all potential security problems against all threats, an FCKMS should be designed to detect potential compromises and unauthorized modifications, to mitigate their undesirable effects, to alert the appropriate parties of compromises, and to recover (or help recover) to a secure state if a compromise or unauthorized modification is discovered. This section addresses how to prepare for a possible key compromise and the steps required for recovery if a compromise occurs.

1938

1939

1940

1941

1942

1943

PR:6.69	CP-2	A Federal CKMS shall create and maintain a compromise-
----------------	------	---

		recovery plan for recovering from actual and suspected compromises of its security and availability.
PR:6.70	CP-2	A Federal CKMS shall perform the following when a compromise is detected or suspected: <ul style="list-style-type: none"> a) Report the compromise to FCKMS management, b) Evaluate the compromise to determine its cause and scope, c) Institute compromise-mitigation measures to minimize key and/or metadata exposure, d) Institute corrective measures to prevent the recurrence of the compromise, and, e) Return the FCKMS to a secure operating state.

1944 **6.8.1 Key Compromise**

1945 Key compromise is the disclosure of a key or its sensitive metadata to one or more
 1946 unauthorized entities, or the modification, substitution, or use of a cryptographic key or
 1947 its sensitive metadata by one or more unauthorized entities. Depending on the key type
 1948 and key usage, the compromise of a key could result in:

- 1949 a) Loss of confidentiality,
- 1950 b) Loss of integrity,
- 1951 c) Loss of authentication,
- 1952 d) Loss of non-repudiation, or
- 1953 e) Some combination of these losses.

1954 Note that a compromise of a secret or private key could result in a compromise of all the
 1955 information protected by the key and access to all security services supported by the key.
 1956 Also, note that the compromise of the sensitive metadata of a key may result in the
 1957 compromise of the key (see Section 6.8.2).

1958
 1959 A key compromise could be prevented, undetected, detected, or suspected. An FCKMS
 1960 should be designed and operated to 1) prevent key compromises, 2) detect actual
 1961 compromises, 3) support the analysis of suspected compromises, and 4) minimize the
 1962 risks of undetected compromises. Establishing a cryptoperiod, or usage limit, for each
 1963 key, can reduce the exposure caused by an undetected compromise⁸. See Section 6.8.1 of
 1964 the Framework for additional discussion.

1965
 1966 A cryptographic key may be used for applying cryptographic protection (e.g., encryption
 1967 or generating a digital signature) or processing cryptographically protected information
 1968 (e.g., decryption or verifying a digital signature). For symmetric algorithms, the same key
 1969 is used both to apply the protection and process the protected information. For public-key

⁸ The usage of keys may be limited based on a criterion, such as the amount of data processed using the key or the number of times the algorithm was initialized using the key.

1970 algorithms, one key of a key pair is used to apply the protection, and the other is used to
 1971 process the protected information; for public-key algorithms, key compromise is
 1972 concerned with the disclosure or modification of the private key of the key pair. Keys
 1973 known or suspected of being compromised must not be used to apply cryptographic
 1974 protection, but they may be used to process cryptographically protected information, if
 1975 required (e.g., for continuity of operations), and the risk of doing so is acceptable.

1976
 1977 An FCKMS should have the ability to rapidly revoke a key (see Section 6.8.3), replace
 1978 keys (both asymmetric and symmetric) and the ability to notify the relying parties (those
 1979 who make use of the key) of a compromise.

1980
 1981 **FR:6.102** The CKMS design **shall** specify the range of acceptable cryptoperiods or usage
 1982 limits of each type of key used by the system.

1983
 1984 **FR:6.103** For each key, a CKMS design **shall** specify the other key types that depend on
 1985 the key for their security and how those dependent keys are to be replaced in the event of
 1986 a compromise of the initial key.

1987
 1988 **FR:6.104** The CKMS design **shall** specify the means by which other compromised keys
 1989 can be identified when a key is compromised. For example, when a key derivation key is
 1990 compromised, how are the derived keys determined?
 1991

PR:6.71		A Federal CKMS shall revoke compromised keys.
PR:6.72		A Federal CKMS shall not use a key whose compromise is known or suspected to apply cryptographic protection.
PR:6.73		A Federal CKMS shall support reporting and investigating a key compromise.

1992

PA:6.22		A Federal CKMS should destroy compromised keys.
PA:6.23		A Federal CKMS should replace compromised/revoked keys with new keys and metadata when continuity of operations is required.
PA:6.24		A Federal CKMS should not use a key whose compromise is known or suspected to process cryptographically protected information.

1993 **6.8.2 Metadata Compromise**

1994 Some metadata may be considered sensitive, while other metadata is not. Metadata
 1995 compromise refers only to the compromise of the sensitive metadata. Depending on the
 1996 metadata element and how it is used, its compromise could result in the compromise of
 1997 one or more keys and the data protected by those keys. If different keys have common

1998 sensitive metadata elements, then the compromise of one sensitive metadata element may
 1999 compromise the data protected by each of the keys. Metadata elements that are sensitive
 2000 to disclosure or unauthorized modification should be cryptographically bound to their
 2001 associated keys so that the integrity of the metadata can be easily verified. Metadata
 2002 elements that are sensitive to disclosure should be physically or cryptographically
 2003 protected.

2004
 2005 **FR:6.105** For each key type employed, the CKMS design **shall** specify which metadata
 2006 elements are sensitive to compromise (confidentiality, integrity, or source).

2007
 2008 **FR:6.106** The CKMS design **shall** specify the potential security consequences, given the
 2009 compromise (confidentiality, integrity or source) of each sensitive metadata element of a
 2010 key.

2011
 2012 **FR:6.107** The CKMS design **shall** specify how each sensitive metadata element
 2013 compromise can be remedied.

2014

PR:6.74		A Federal CKMS shall revoke the key associated with compromised sensitive metadata.
PR:6.75		A Federal CKMS shall support reporting and investigating a compromise of sensitive metadata.

2015

PR:6.76		A Federal CKMS should destroy the keys whose sensitive metadata has been compromised, and also destroy all the sensitive metadata associated with that key.
----------------	--	--

2016 **6.8.3 Key and Metadata Revocation**

2017 Keys could be revoked for a number of reasons, including key compromise, metadata
 2018 compromise, and the termination of an employee or the employee’s role within an
 2019 organization. Additional information is provided in Section 6.8.3 of the Framework.

2020
 2021 **FR:6.108** A CKMS design **shall** specify the key revocation mechanism(s) and associated
 2022 relying-entity notification mechanism(s) used or available for use.

2023 **6.8.4 Cryptographic Module Compromise**

2024 Since a cryptographic module contains plaintext keys at some point during its operation,
 2025 physical access to, and compromise of, a cryptographic module could compromise the
 2026 symmetric and private keys contained within the module, as well as any sensitive
 2027 metadata contained in the module. This could lead to the loss of confidentiality and/or
 2028 integrity of the keys and metadata.

2029
 2030 Cryptographic modules could be compromised either physically (i.e., obtaining keys
 2031 from within the module enclosure) or by non-invasive methods (i.e., obtaining keys, or
 2032 knowledge about the keys via some external action). Physical protection could be

2033 provided to the modules by enclosing them in a facility or a protected space where
 2034 unauthorized access is prevented or where unauthorized access could be quickly detected.
 2035 Some modules provide this protection at their cryptographic boundary (see [FIPS 140]).
 2036 If any access to the contents of a cryptographic module is possible, then an access control
 2037 system should restrict access to authorized parties.

2038
 2039 Following an actual or suspected cryptographic module compromise, a secure state of the
 2040 module should be re-established before the module is returned to normal operation.
 2041 Following repair or replacement, the security and correct operation of a module should be
 2042 tested and approved before it becomes operational.

2043
 2044 **FR:6.109** The CKMS design **shall** specify how physical and logical access to the
 2045 cryptographic module contents is restricted to authorized entities.

2046
 2047 **FR:6.110** The CKMS design **shall** specify the approach to be used to recover from a
 2048 cryptographic module compromise.

2049
 2050 **FR:6.111** The CKMS design **shall** describe what non-invasive attacks are mitigated by
 2051 the cryptographic modules used by the system and provide a description of how the
 2052 mitigation is performed.

2053
 2054 **FR:6.112** The CKMS design **shall** identify any cryptographic modules that are
 2055 vulnerable to non-invasive attacks.

2056
 2057 **FR:6.113** The CKMS design **shall** provide the rationale for accepting the vulnerabilities
 2058 caused by possible non-invasive attacks.

2059
 2060 An FCKMS must use cryptographic modules that protect against unauthorized access to
 2061 their contents (see Section 2.10 for requirements). Physically compromised cryptographic
 2062 modules must be replaced. An FCKMS must control physical access to all its devices,
 2063 modules, and cryptographic modules (see Section 6.8.8 for requirements).

2064

PR:6.77		A Federal CKMS shall repair or replace a compromised cryptographic module and then verify its correct operation and security before it is returned to operational status.
----------------	--	--

2065 **6.8.5 Computer System Compromise Recovery**

2066 The security of an FCKMS often depends on the security and integrity of its own
 2067 computer systems, including its hardware, software, and data. Unauthorized access to,
 2068 or modifications of, any of these could corrupt its secure operation. Unauthorized
 2069 modification of FCKMS software or of a computer’s operating system could be detected
 2070 using tools that run on a separate secure platform and by monitoring any unauthorized
 2071 modification to a file, changes to the hash value of a file’s contents, or changes to a file’s
 2072 attributes. Alternatively, a layered system of protections could be built into the system; in
 2073 this case, the mechanisms would need to be protected from the same threats as the system

2074 itself. When critical files undergo unauthorized modifications that are detected by the
 2075 monitor or are indicated in the event log, then these files should be replaced with known
 2076 valid and secure files obtained from secure storage.
 2077

2078 An FCKMS could incorporate automated monitoring devices and software that detect
 2079 certain threats or compromises. For example, some communication networks monitor for
 2080 and detect errors that accidentally occur or have been induced in the network. If a
 2081 network uses error-detection codes for communications, the monitor could detect error
 2082 propagation characteristics that are outside the norm and initiate some compensating
 2083 action to minimize the result of this type of compromise. If cryptographic-based
 2084 Message Authentication Codes (MACs) are used on communications, both deliberate and
 2085 accidental modification to the data (e.g., keys and metadata) could be detected. Non-
 2086 cryptographic error-detection codes are not intended to detect deliberate modifications.
 2087

2088 **FR:6.114** The CKMS design **shall** specify the mechanisms used to detect unauthorized
 2089 modifications to the CKMS system hardware, software and data.
 2090

2091 **FR:6.115** The CKMS design **shall** specify how the CKMS recovers from unauthorized
 2092 modifications to the CKMS system hardware, software and data.
 2093

PR:6.78	CP-10	A Federal CKMS shall support the recovery of a system from backups after the detection of an unauthorized system modification.
PR:6.79		A Federal CKMS shall respond to a computer operating-system compromise as specified in the Compromise Recovery Plan.

2094

PF:6.8		A Federal CKMS could automatically detect and report some compromise types, obtain upgrades that will deter or prevent similar future compromises, and then return the system to a known secure state.
---------------	--	---

2095 **6.8.6 Network Security Controls and Compromise Recovery**

2096 A compromise of any network security control that provides protection to the
 2097 communications within an FCKMS could result in the compromise of the FCKMS itself,
 2098 including its keys. See Section 6.8.6 of the Framework for additional information.
 2099

2100 Whenever network security has been compromised, the incident should be fully
 2101 investigated to determine what other systems and what keys may have been compromised
 2102 due to the compromise of the network.
 2103

2104 **FR:6.116** The CKMS design **shall** specify how to recover from the compromise of the
 2105 network security control used by the system. Specifically,

- 2106 a) The CKMS design **shall** specify the compromise scenarios considered for each
- 2107 network security control device,
- 2108 b) The CKMS design **shall** specify which of the mitigation techniques specified in
- 2109 this section are to be employed for each envisioned compromise scenario, and
- 2110 c) The CKMS design **shall** specify any additional or alternative mitigation
- 2111 techniques that are to be employed.

PR:6.80		<p>If network passwords are compromised, a Federal CKMS shall:</p> <ul style="list-style-type: none"> a) Replace any passwords that are compromised or suspected of being compromised, b) Notify entities that may be affected by the compromise, c) Perform an assessment of any damage that could have resulted to the FCKMS, and d) Take corrective actions that would reduce the likelihood of similar failures.
PR:6.81		<p>If the network security is compromised, a Federal CKMS shall:</p> <ul style="list-style-type: none"> a) Investigate the cause of the compromise, b) Report the compromise to the system administrator, the CKMS designer, and/or the vendor of the compromised product, c) Determine the extent to which keys and metadata have been compromised (if possible), d) Install appropriate fixes so that the compromise will not reoccur, and e) Replace all compromised keys and sensitive metadata.

2112

PA:6.25		<p>A Federal CKMS should take corrective measures for network security compromises, including:</p> <ul style="list-style-type: none"> a) Installing the latest network security patches, b) Changing network security devices if improved ones are available, c) Upgrading network security configurations, and d) Disabling obsolete or unused protocols.
----------------	--	---

2113 **6.8.7 Personnel Security Compromise Recovery**

2114 Anyone that is responsible for the secure operation of an FCKMS might have the

2115 capability to compromise its security. An FCKMS should be designed and operated with

2116 the capabilities to minimize the likelihood of any successful human-initiated

2117 compromise, and detect, minimize the negative consequences and efficiently recover

2118 from such compromises.

2119

2120 Any detected security failure should result in the initiation of recovery procedures, based
 2121 upon the Information Security Policy and the FCKMS capabilities.

2122
 2123 **FR:6.117** The CKMS design **shall** specify any personnel compromise detection features
 2124 that are provided for each supported role.

2125
 2126 **FR:6.118** The CKMS design **shall** specify any personnel compromise minimization
 2127 features that are provided for each supported role.

2128
 2129 **FR:6.119** The CKMS design **shall** specify the CKMS compromise recovery capabilities
 2130 that are provided for each supported role.

2131

PR:6.82	PS-2	A Federal CKMS shall perform an assessment of the potential consequences of personnel security compromises before the FCKMS initially becomes operational.
PR:6.83	PL-1 PS-1	A Federal CKMS shall develop procedures for recovering from a personnel security compromise.
PR:6.84	AU-6 PS-1	A Federal CKMS shall perform an audit of its personnel security actions after a personnel security compromise is detected, and issue revisions to the FCKMS operations documentation that would reduce similar compromises.
PR:6.85		A Federal CKMS shall perform an audit of personnel security actions when a personnel security compromise is detected, and issue revisions to operations manuals that would reduce such future compromises.

2132

PA:6.26		<p>A Federal CKMS should:</p> <ul style="list-style-type: none"> a) Minimize the ability of personnel accessing the FCKMS to hide any actions that could cause a security failure, b) Maintain audit records that aid in determining who or what caused the security failure, and c) Mitigate the negative consequences of a failure due to a personnel compromise.
PA:6.27		<p>A Federal CKMS should perform the following after detecting an actual or probable compromise of security:</p> <ul style="list-style-type: none"> a) Shut down the compromised system, b) Activate a backup facility and system with new keys or uncompromised keys, c) Notify current and potential users of the possible security compromise, and d) Revoke compromised keys.

2133 **6.8.8 Physical Security Compromise Recovery**

2134 Physical security should be used to both prevent and detect security compromises. In
 2135 addition to the disclosure or destruction of keys, a physical security breach of an FCKMS
 2136 module could result in compromises to the integrity of any of its internal components. A
 2137 cryptographic module may be designed with adequate physical protections, but if
 2138 security-related logic resides outside of the cryptographic module, then the integrity of
 2139 that logic also needs protection. Techniques similar to those used by the cryptographic
 2140 module should be employed. An FCKMS should support both prevention and detection
 2141 mechanisms against physical compromises.

2142
 2143 If the physical security of an FCKMS module is breached, all sensitive data within the
 2144 breached area should be suspected of being compromised. The FCKMS components
 2145 associated with the FCKMS module should be examined to detect any unauthorized
 2146 modification or replacement. Compromised components should be repaired or replaced
 2147 to prevent new keys and sensitive information from being compromised in the future.

2148
 2149 **FR:6.6.120** The CKMS design **shall** specify how all CKMS components and devices are
 2150 protected from unauthorized physical access.

2151
 2152 **FR:6.121** The CKMS design **shall** specify how the CKMS detects unauthorized physical
 2153 access.

2154
 2155 **FR:6.122** The CKMS design **shall** specify how the CKMS recovers from unauthorized
 2156 physical access to components and devices other than cryptographic modules.

2157
 2158 **FR:6.123** The CKMS design **shall** specify the entities that are automatically notified if a
 2159 physical security breach of any CKMS component or device is detected by the CKMS.

2160
 2161 **FR:6.124** The CKMS design **shall** specify how breached areas can be re-established to a
 2162 secure state.

2163

PR:6.86	IR-4 IR-6	A Federal CKMS shall support the notification of an appropriate authority of any actual or suspected physical-security compromise and initiating mitigation actions by that authority.
PR:6.87		A Federal CKMS shall control physical access to FCKMS devices and restrict access to only authorized entities.
PR:6.88	PS-3	A Federal CKMS shall support the evaluation of each new individual before being authorized to perform any role involving FCKMS security.
PR:6.89	PE-2 (2)	For High impact-level systems, a Federal CKMS shall support multi-factor physical access control of all personnel having physical access to the FCKMS.

2164

PA:6.28	PE-2 (2)	For Moderate impact-level systems, a Federal CKMS should support multi-factor physical access control of all personnel having physical access to the FCKMS.
----------------	----------	--

2165

2166

PF:6.9	PE-2 (2)	For Low impact-level systems, a Federal CKMS could support a multi-factor physical access control of all personnel having possible access to an FCKMS and its components.
---------------	----------	--

2167

2201

In general, interoperability is the ability of diverse systems to communicate and work together (i.e., to inter-operate). In this document, two or more entities may be considered interoperable if they are able to exchange cryptographic keys in a manner that complies with Federal standards and is considered sufficiently secure by both entities. Since this document allows for a variety of implementations to service many diverse applications, compliance with this document does not by itself guarantee interoperability. Interoperability can only be achieved by having a detailed specification and common protocols to which all communicating entities intend to comply. These specifications and protocols may differ, depending on the applications being serviced. If no interoperability is required, then the PRs containing conditional interoperability phases are not applicable.

An FCKMS should use cryptographic algorithms and keys whose anticipated security lifetimes will span the maximum lifetime of the information being protected. If the FCKMS is intended to remain in service beyond the security lifetimes of its cryptographic algorithms, then there should be a transition strategy for migration to stronger algorithms in the future. Cryptographic algorithms should be implemented so that they can be replaced when needed. [SP 800-57 Part 1] and [SP 800-131A] specify NIST-recommended lifetimes of NIST-approved cryptographic algorithms. [SP 800-57 Part 1] provides transition guidance.

FR:7.1 The CKMS design **shall** specify how interoperability requirements across device interfaces are to be satisfied.

FR:7.2 The CKMS design **shall** specify the standards, protocols, interfaces, supporting services, commands and data formats required to interoperate with the applications it is intended to support.

FR:7.3 The CKMS design **shall** specify the standards, protocols, interfaces, supporting services, commands and data formats required to interoperate with other CKMS for which interoperability is intended.

FR:7.4 The CKMS design **shall** specify all external interfaces to applications and other CKMS.

- 2202 **FR:7.5** The CKMS design **shall** specify all provisions for transitions to new,
 2203 interoperable, peer devices.
 2204
 2205 **FR:7.6** The CKMS design **shall** specify any provisions provided for upgrading or
 2206 replacing its cryptographic algorithms.
 2207
 2208 **FR:7.7** The CKMS design **shall** specify how interoperability will be supported during
 2209 cryptographic algorithm transition periods.
 2210
 2211 **FR:7.8** The CKMS design **shall** specify its protocols for negotiating the use of
 2212 cryptographic algorithms and key lengths.
 2213

PR:7.1		When interoperability is required, and a symmetric block-cipher algorithm is to be used for encryption, a Federal CKMS shall support AES-128 in the CBC mode as the default for Low and Moderate impact levels, and AES-256 in the CBC mode as the default for High impact levels, as specified in [FIPS 197] and [SP 800-38A].
PR:7.2		When interoperability is required, and a symmetric block-cipher algorithm is to be used for message authentication only ⁹ , a Federal CKMS shall support AES-128 in the CMAC mode for Low and Moderate impact levels as the default, and AES-256 in the CMAC mode as the default for High impact levels, as specified in [FIPS 197] and [SP 800-38B].
PR:7.3		When interoperability is required, and a symmetric block-cipher algorithm is to be used for authenticated encryption, a Federal CKMS shall support AES-128 in the GCM mode as the default for Low and Moderate impact levels, and AES-256 in the GCM mode as the default for High impact levels, as specified in [FIPS 197] and [SP 800-38D].
PR:7.4		When interoperability is required, and a symmetric block-cipher algorithm is to be used for key wrapping, a Federal CKMS shall support AES-128 in the GCM mode as the default for Low and Moderate impact levels, and AES-256 in the GCM mode as the default for High impact levels, as specified in [FIPS 197] and [SP 800-38D].
PR:7.5		When interoperability is required, and a hash function is to be used, an FCKMS shall support SHA-256 as the default for Low and Moderate impact levels, and SHA-384 as the default for High impact levels, as specified in [FIPS 180].

⁹ As opposed to authenticated encryption, which is addressed in PR:7.3.

PR:7.6		When interoperability is required, and HMAC is to be used, a Federal CKMS shall support HMAC-SHA-1 as the default for Low impact levels, HMAC-SHA-256 as the default for Moderate impact levels, and HMAC-SHA-384 as the default for High impact levels, as specified in [FIPS 198] and [FIPS 180].
PR:7.7		When interoperability is required, a Federal CKMS shall use a NIST-approved key establishment scheme to support establishing a key and associated metadata between entities.
PR:7.8		When interoperability is required, and an interactive, finite-field key-agreement scheme is to be used for key establishment, a Federal CKMS shall support the dhEphem scheme specified in [SP 800-56A] as the default scheme, with the concatenation KDF employing SHA-256 as the default key-derivation method for Low and Moderate impact levels, and SHA-384 for High impact levels.
PR:7.9		When interoperability is required, and an interactive, elliptic-curve key-agreement scheme is to be used for key establishment, a Federal CKMS shall support the Ephemeral Unified Model scheme specified in SP 800-56A with curve P-256 as the default scheme, with the concatenation KDF employing SHA-256 as the default key-derivation method for Low and Moderate impact levels, and curve P-384 and SHA-384 for High impact levels.
PR:7.10		When interoperability is required, an RSA scheme is to be used for key agreement, and both participants are to use key pairs during the transaction, a Federal CKMS shall support the KAS2 scheme from [SP 800-56B], with the concatenation KDF employing SHA-256 as the default key-derivation method for Low and Moderate impact levels, and SHA-384 for High impact levels.
PR:7.11		When interoperability is required, and a one-way (e.g., store-and-forward), finite-field key-agreement scheme is to be used for key establishment, a Federal CKMS shall support the dhOneFlow scheme specified in [SP 800-56A] as the default scheme, with the concatenation KDF employing SHA-256 as the default key-derivation method for Low and Moderate impact levels, and SHA-384 for High impact levels.

PR:7.12		When interoperability is required, and a one-way (e.g., store-and-forward), elliptic-curve key-agreement scheme is to be used for key establishment, a Federal CKMS shall support the One-pass Diffie-Hellman scheme specified in [SP 800-56A] with curve P-256 as the default scheme, with the concatenation KDF employing SHA-256 as the default key-derivation method for Low and Moderate impact levels, and curve P-384 and SHA-384 for High impact levels.
PR:7.13		When interoperability is required, an RSA key agreement scheme is to be used for key establishment, and only the initiator's key is to be used during the transaction, a Federal CKMS shall support the KAS1 scheme specified in [SP 800-56B] as the default scheme, with the concatenation KDF employing SHA-256 as the default key-derivation method for Low and Moderate impact levels, and SHA-384 for High impact levels.
PR:7.14		When interoperability is required, and an RSA key-transport scheme is to be used for key establishment, a Federal CKMS shall support the RSA-OAEP scheme specified in [SP 800-56B] as the default scheme ¹⁰ .
PR:7.15		When interoperability is required, and key derivation from a pre-shared secret is to be performed, a Federal CKMS shall support HMAC in the counter mode as specified in [SP 800-108] as the default method, using SHA-256 as the hash function for Low and Moderate impact levels, and SHA-384 for High impact levels.
PR:7.16		When interoperability is required, and digital signature generation and verification is to be performed using ECDSA, a Federal CKMS shall support curve P-256 as the default curve and SHA-256 as the default hash function to be used for Low and Moderate impact levels, and curve P-384 and SHA-384 for High impact levels.
PR:7.17		When interoperability is required, and digital signature generation and verification is to be performed using RSA, a Federal CKMS shall support the RSASSA-PSS signature scheme as the default scheme.

¹⁰ Note to the reader: While PKCS v1.5 is commonly used, it is not among the schemes that are NIST-approved in [SP 800-56B].

PR:7.18		A CKMS shall use only cryptographic algorithms whose security lifetimes extend up to or beyond the anticipated lifetime of the FCKMS itself and the information that it protects, or have a transition strategy for migration to stronger algorithms and longer key lengths in the future.
PR:7.19		A Federal CKMS shall maintain and use transition plans that include the selection and use of cryptographic algorithm(s) and key length(s) to be used during a transition period.

2214

PA:7.1		A Federal CKMS should support the update or replacement of cryptographic algorithms, and do so in a manner that does not significantly impact FCKMS operations.
---------------	--	--

2215

PF:7.1		<p>A Federal CKMS could implement provisions that support transitions to new algorithms or key lengths. Such provisions include:</p> <ul style="list-style-type: none"> a) Common interfaces, b) Common formats for keys, metadata, and associated protection mechanisms, c) Common procedures for cryptographically associating (e.g., binding) metadata to their keys, and d) Cryptographic algorithms that can be replaced, when needed.
---------------	--	--

2216

8 Security Controls

2217
2218
2219
2220
2221
2222
2223
2224

An FCKMS consists of one or more computer systems, communication services, devices, FCKMS modules, cryptographic modules, firewalls, communications and human interfaces, backup storage media, archive facilities, network security protocols, and entity identification systems. An FCKMS requires security mechanisms and management to protect these components, along with the keys and metadata that they contain. These controls include physical security controls, operating system and device security controls, auditing and remote monitoring, network security controls and cryptographic module controls.

2225

8.1 Physical Security Controls

2226
2227
2228
2229
2230

Physical security is needed to protect the availability, reliability, and integrity of an FCKMS and to ensure the security and availability of its data-processing resources, including all key-management information and support software. Without good physical security, the FCKMS hardware and software could be modified to negate or bypass security mechanisms.

2231
2232
2233

An FCKMS may include facilities that provide third-party key-management services (such as a Certification Authority, Key Distribution Center, Registration Authority, or

2234 Certificate Directory) and end-to-end communication devices (such as personal
 2235 computers, personal digital assistants, smart phones, and intelligent sensing devices). A
 2236 facility is traditionally considered to be a building or room that houses equipment and
 2237 support personnel in a fixed or “static” facility/environment. However, in today’s world
 2238 of mobile “smart” devices, the definition of a facility needs to be expanded to include the
 2239 enclosure in which a mobile FCKMS module is contained (e.g., a computer laptop case,
 2240 or cell phone protective cover), with some protection provided by its owner/user. A
 2241 mobile device enclosure and the person carrying the enclosed device should provide
 2242 protection that is similar to that available in a static facility and environment. In some
 2243 instances, an FCKMS could encompass a variety of static and mobile facilities.

2244
 2245 In a static environment, an FCKMS module could be protected by gated fences, locked
 2246 doors, smart-card access-control systems, password verifiers, surveillance cameras, and
 2247 guards. In a mobile environment, security will depend on the room or enclosure in which
 2248 the mobile device and FCKMS module are currently operating, the person operating the
 2249 mobile device, and perhaps a personal identity-verification (PIV) mechanism that is built
 2250 into the device that requires an authorized owner/user to enter a special access token,
 2251 secret password, and/or personal biometric characteristic (e.g., fingerprint).

2252
 2253 **FR:8.1** The CKMS design **shall** specify each of its CKMS devices and their intended
 2254 purposes.

2255
 2256 **FR:8.2** The CKMS design **shall** specify the physical security controls for protecting each
 2257 device containing CKMS components.

2258

PR:8.1		A Federal CKMS shall support the physical protection of FCKMS modules, cryptographic modules, components, devices, and unencrypted keys and sensitive metadata.
---------------	--	--

2259 **8.2 Operating System and Device Security Controls**

2260 This section addresses security controls for FCKMS computer operating systems and
 2261 devices. Note that an FCKMS module or device that incorporates a general-purpose
 2262 operating system should also have computer security controls.

2263 **8.2.1 Operating System Security**

2264 A trusted (secure) operating system manages data to make sure that it can be altered,
 2265 moved, or viewed only by entities having appropriate and authorized access rights. A
 2266 trusted operating system should be the foundation of every modern, shared computing
 2267 system, personal computer, and “smart” device. Without a trusted operating system, the
 2268 security of the control programs, applications, and data on these personal devices cannot
 2269 be assured. Section 8.2.1 of the Framework provides guidance on the security features
 2270 that should be provided in trusted operating systems. A trusted operating system depends
 2271 on a secure hardware platform running secure (operating system) software. The platform
 2272 often supports two or more physically or logically separated processing capabilities in

2273 order to isolate keys, metadata, security services, and cryptographic functions according
2274 to their impact levels, applications, users, or FCKMS Security Policies.

2275 An FCKMS module might run on a general-purpose computer where non-validated
2276 application code is permitted. In such cases, a trusted operating system should be used to
2277 protect sensitive code and data from the non-validated code. The operating system should
2278 protect itself from all applications and should separate applications from each other. A
2279 trusted operating system is designed to provide these separations and is “trusted” to
2280 maintain a secure environment. The trusted operating system, including the hardware
2281 platform, can enforce two or more states in order to support privileged operations, such as
2282 memory management, I/O management, and secure cryptographic function calls.

2283 Software integrity in an FCKMS must be maintained to prevent unauthorized disclosure
2284 and modification of the keys and metadata. This may be supported by using mechanisms
2285 such as hash functions, message authentication codes, and digital signatures, all of which
2286 can be used to detect any modification to the software. Software integrity should be
2287 verified when the software is received from its supplier, after initial installation, upon
2288 system startup, and periodically thereafter.

2289 Hardening is the process of eliminating a means of attack by patching vulnerabilities and
2290 turning off nonessential services. Hardening a computer involves several steps to form
2291 layers of protection. Hardening guidelines specify the procedures to be followed when
2292 hardening a system.

2293
2294
2295 **FR:8.3** The CKMS design **shall** specify all trusted (secure) operating system
2296 requirements (including any required operating system configurations) for each CKMS
2297 device.

2298
2299 **FR:8.4** The CKMS design **shall** specify which of the following hardening¹¹ features are
2300 enforced by the CKMS:

- 2301 a) Removing all non-essential software programs and utilities from the computer;
- 2302 b) Using the principle of least privilege to control access to sensitive system features
2303 and applications;
- 2304 c) Using the principle of least privilege to control access to sensitive system and
2305 application files and data;
- 2306 d) Limiting user accounts to those needed for legitimate operations, i.e., disabling or
2307 deleting the accounts that are no longer required;
- 2308 e) Running the applications with the principle of least privilege;
- 2309 f) Replacing all default passwords and keys with strong passwords and randomly
2310 generated keys, respectively;

¹¹ Hardening is the process used to eliminate a means of attack by patching vulnerabilities and turning off nonessential services.

- 2311 g) Disabling or removing network services that are not required for the operation of
- 2312 the system;
- 2313 h) Disabling or removing all other services that are not required for the operation of
- 2314 the system;
- 2315 i) Disabling removable media, or disabling automatic run features on removable
- 2316 media and enabling automatic malware checks upon media introduction;
- 2317 j) Disabling network ports that are not required for the system operation;
- 2318 k) Enabling optional security features as appropriate; and
- 2319 l) Selecting other configuration options that are secure.

2320
 2321 **FR:8.5:** The CKMS design **shall** specify the BIOS protection features that ensure the
 2322 proper instantiation of the operating system.
 2323

<p>PR:8.2</p>	<p>CM-7 SI-3</p>	<p>A Federal CKMS shall support the following hardening principles:</p> <ul style="list-style-type: none"> a) Non-essential software is removed from computers, b) Non-essential network services are disabled, c) Non-essential FCKMS services are disabled or removed, d) Non-essential, removable data storage media or automatic run features on removable media are disabled, e) Automatic malware checks on newly attached data-storage medium are enabled, f) Non-essential network ports are disabled, g) The latest system patches are installed, h) The latest malware-detection software is installed, i) The appropriate file system, directory and register settings have been determined and properly configured, j) The appropriate security-relevant information to be logged has been determined and properly configured, k) The required amount of physical security has been determined and implemented, l) Default passwords and keys have been replaced with strong passwords and randomly generated keys, respectively, especially for administrator accounts, m) Unnecessary usernames and passwords have been removed, including those associated with users no longer authorized to use the system, and n) Users and access privileges have been limited to those needed for essential operations.
<p>PR:8.3</p>	<p>SI-7</p>	<p>A Federal CKMS shall maintain software integrity.</p>

PR:8.4	CM-7	A Federal CKMS shall protect access to sensitive keys and metadata by non-validated software.
PR:8.5	SI-6	The software for Moderate and High impact-level systems shall be implemented with an integrity mechanism, and the integrity of the software shall be verified during system startup.
PR:8.6	SC-2 SC-3	For Moderate and High impact-level systems, a Federal CKMS shall use trusted operating systems that separate sensitive user applications and their data from each other.
PR:8.7	AC-3 (2)	For High impact-level systems, a Federal CKMS shall provide multiparty control of those system functions that are considered by the FCKMS management authorities to be most critical to the security provided by the FCKMS.

2324

PA:8.1	SI-6	The software for Low impact-level systems should be implemented with an integrity mechanism, and the integrity of the software should be verified during system startup.
---------------	------	--

2325

PF:8.1	SC-2 SC-3	For Low impact-level systems, a Federal CKMS could use trusted operating systems that separate sensitive user applications from each other and from the operating system.
---------------	--------------	--

2326 8.2.2 Individual FCKMS Device Security

2327 An FCKMS may consist of a variety of devices. An FCKMS should be designed to
 2328 protect itself from FCKMS device users and other FCKMS devices, provide separate
 2329 sessions for users and user processes, provide fine-grained access controls on FCKMS
 2330 device-level objects, provide device-level security-event logging, and provide user
 2331 account management.

2332
 2333 A verification that an FCKMS device is operating correctly and securely should be
 2334 established at device startup and verified periodically. The security controls incorporated
 2335 into an FCKMS device could be configurable to support differences in FCKMS service-
 2336 using organizations, security policies, and environments. Specific security-relevant
 2337 events (such as a physical security alarm, electric power failure, unrecoverable
 2338 communication errors, and human-initiated alarms) could result in different responses,
 2339 depending on these differences.

2340

2341 **FR:8.6** The CKMS design **shall** specify the security controls required for each CKMS
 2342 device.

2343

2344 **FR:8.7** The CKMS design **shall** specify the device/CKMS secure configuration
 2345 requirements and guidelines that the hardening is based upon.

2346

PR:8.8	SI-6	During system startup, a Federal CKMS shall verify that each of its devices is operating correctly and in a secure state.
---------------	------	--

2347

PF:8.2		A Federal CKMS device could be manually or automatically configurable to support, comply with, and enforce new FCKMS Security Policies.
---------------	--	--

2348 **8.2.3 Malware Protection**

2349 When an FCKMS receives operating-system software, software updates and software
 2350 support over unprotected electronic communication networks or via untrusted manual
 2351 software distribution services, the scanning of these data items for malware may be
 2352 required before installation. Scanning must be performed when the data items are
 2353 untrusted, i.e., they are received from an unauthenticated or untrustworthy source, or the
 2354 data does not have sufficient cryptographic protection against undetected alteration, as
 2355 determined by the impact level of the data in the system.

2356

2357 Malware protection falls into the following three general categories:

2358

2359 a) Anti-virus software that protects an FCKMS and its components from installing
 2360 and executing programs that modify or reproduce themselves without
 2361 authorization, sending copies of modified versions of themselves to other
 2362 components, performing unintended and unauthorized actions, and, in general,
 2363 causing a security compromise;

2364

2365 b) Anti-spyware software that protects an FCKMS and its components from an
 2366 unauthorized party obtaining system administrator status or authorized user status,
 2367 collecting unauthorized information from other parts of the FCKMS, and taking
 2368 on unauthorized FCKMS component behavior; and,

2369

2370 c) Rootkit detection and prevention software that protects an FCKMS and its devices
 2371 from rootkit malware that makes unauthorized changes to the configuration
 2372 settings of the operating system, and hides unauthorized changes to the FCKMS
 2373 operating system software, processes, and files, including the rootkit code itself,
 2374 from anti-virus and anti-spyware software.

2375

2376 In order to be effective, malware protection should include verifying the identity of the
 2377 source of the received software upon receipt, and scanning the software for malware upon
 2378 initial receipt and periodically thereafter (e.g., upon reloading).
 2379

2380 **FR:8.8** The CKMS design **shall** specify the following malware protection capabilities for
 2381 CKMS devices:

- 2382 a) Anti-virus protection software, including the specified time periods and events
 2383 that trigger anti-virus scans, software update, and virus signature database
 2384 updates;
- 2385 b) Anti-spyware protection software, including the specified time periods and events
 2386 that trigger anti-spyware scans, software update, and virus signature updates; and
- 2387 c) Rootkit detection and protection software, including the specified time periods
 2388 and events that trigger rootkit detection, software update, and signature updates.
 2389

2390 **FR:8.9** The CKMS design **shall** specify the following software integrity check
 2391 information for operating system and CKMS application software:

- 2392 a) If software integrity is verified upon installation, indicate how the verification is
 2393 performed; and
- 2394 b) If software integrity is verified periodically, indicate how often the verification is
 2395 performed.
 2396

PR:8.9		When untrusted software, software updates and software support may be introduced into the FCKMS, then the Federal CKMS shall support the following malware protection capabilities for itself and its devices: a) Anti-virus protection software, b) Anti-spyware protection software, and c) Rootkit detection and protection software.
PR:8.10		When a Federal CKMS receives untrusted software, software updates or software support, then the FCKMS shall perform the following before installation: a) Cryptographically verify the source and integrity of a software/firmware update before installing the update, b) Scan received data (including keys and metadata) when first received, and c) Verify that the updated software/firmware contains no malware before running it.
PR:8.11	RA-5 SI-4	When a Federal CKMS is allowed to receive untrusted software, software updates or software support, then the FCKMS shall be configured to perform (at a minimum): a) A weekly scan of installed software, b) A scan of removable media when first introduced into

		<p>the CKMS,</p> <p>c) A scan of newly installed software and data files,</p> <p>d) A weekly update of the malware protection software, and</p> <p>e) A weekly update of the malware signature database.</p>
PR:8.12	RA-5 SI-3 SI-4	When a Federal CKMS is allowed to receive untrusted software, software updates or software support, then the Federal CKMS shall support time-initiated and event-initiated malware scanning.

2397

PA:8.2	SI-4	A Federal CKMS should support configurable, dynamic network malware monitoring.
---------------	------	--

2398

PF:8.3	SI-4	A Federal CKMS could support dynamic network malware monitoring and report any identified real or potential problems to the FCKMS management personnel.
---------------	------	--

2399 **8.2.4 Auditing and Remote Monitoring**

2400 An FCKMS should monitor security-relevant events by detecting and recording these
 2401 events in an audit log. The audit capability should also have the ability to detect any
 2402 unusual events that should be investigated and report them to the audit administrator role
 2403 as soon as possible. The audit capability and audit log must be protected from
 2404 modification so that the integrity of the audit system can be assured.

2405

2406 Automated assessment tools, such as those specified in the Security Content Automation
 2407 Protocol (SCAP) (see [SP 800-126]), should be considered for assessing the current
 2408 security status and integrity of an FCKMS. Such monitoring tools could execute on the
 2409 platform being monitored or on a platform dedicated to monitoring other computers.

2410

2411 **FR:8.10** The CKMS design **shall** specify the auditable events supported and indicate
 2412 whether each event is fixed or selectable.

2413

2414 **FR:8.11** For each selectable, auditable event, the CKMS design **shall** specify the role(s)
 2415 that has the capability to select the event.

2416

2417 **FR:8.12** For each auditable event, the CKMS design **shall** specify the data to be
 2418 recorded¹².

2419

¹² Examples of recorded data include a unique event identifier, the date and time of the event, the subject (e.g., user, role or software process) causing the event, the success or failure of the event, and the event-specific data.

2420 **FR:8.13** The CKMS design **shall** specify what automated tools are provided to assess the
 2421 correct operation and security of the CKMS.
 2422
 2423 **FR:8.14** The CKMS design **shall** specify system-monitoring requirements for sensitive
 2424 system files to detect and/or prevent their modification or any modification to their
 2425 security attributes, such as their access control lists.
 2426

PR:8.13	AU-9	A Federal CKMS shall protect its audit capability and audit logs from modification and unauthorized disclosure.
PR:8.14		A Federal CKMS shall support the detection of attempted, but unauthorized, key and metadata access, modification, and destruction.
PR:8.15	AU-2 AU-3	<p>A Federal CKMS shall support the auditing of the following security-relevant events and the data to be recorded about them:</p> <ul style="list-style-type: none"> a) Key generation: requestor’s ID, key ID, key type, and date/time; b) Key owner registration: requestor’s ID, owner’s ID, key ID, authorizer’s ID, and date/time; c) Key revocation: requestor’s ID, key ID, reason for revocation, and date/time; d) Key destruction: requestor’s ID, key ID, reason for destruction, and date/time; e) Unauthorized key and metadata modification: requestor’s ID, modification requested, and date/time; f) Key-metadata recovery from backup or archived storage: requestor’s ID, key-ID, key-recovery agent’s ID and date/time; g) Repetitive attempts of unauthorized key access: requestor’s ID, action requested, reason for rejection, and date/time. h) Key establishment: type (manual, automated), key-agreement or key-transport scheme (if appropriate), entity IDs, date/time; i) DRBG Reseed: which DRBG instance, whether requested or automatic, requestor ID (if applicable), source of entropy input, date/time.
PR:8.16	SI-4 SI-7 (+2)	For Moderate and High impact-level systems, a Federal CKMS shall support the monitoring of its internal components, modules, devices, services, functions, and files in order to detect and/or prevent their modification, and then report the results of this monitoring to an FCKMS audit administrator.

PR:8.17	AU-2	For Moderate and High impact-level systems, a Federal CKMS shall support the ability for the FCKMS auditor and administrator roles to select the security-relevant events to be audited.
PR:8.18		For Moderate and High impact-level systems, a Federal CKMS shall support the use of SCAP to monitor the status and integrity of an FCKMS.
PR:8.19	AC-3	A Federal CKMS shall support the individual accountability of all its users, key owners, and FCKMS management personnel, except in the case of Low-impact systems if anonymity is explicitly allowed for the user role and capability.

2427

PA:8.3	SI-4 SI-7 (+2)	For Low impact-level systems, a Federal CKMS should support the monitoring of its internal components, modules, devices, services, functions, and files in order to detect and/or prevent their modification, and then report the results of this monitoring to an FCKMS audit administrator.
PA:8.4	AU-2	For Low impact-level systems, a Federal CKMS should support the ability for the FCKMS auditor and administrator roles to select the security-relevant events to be audited.
PA:8.5		For Low impact-level systems, a Federal CKMS should support the use of SCAP to monitor the status and integrity of an FCKMS.

2428 **8.3 Network Security Control Mechanisms**

2429 Network security-control mechanisms should be used to protect computer systems and
 2430 their network communications against unauthorized access and use. They should be used
 2431 to detect and prevent network activities that could reduce the security of the transmitted
 2432 information, especially the cryptographic keys and sensitive metadata.

2433
 2434 Networked FCKMS devices should be protected using a combination of firewalls and
 2435 intrusion detection and prevention systems as boundary-control devices. These devices
 2436 should be placed in physically secure locations and used to protect FCKMS users,
 2437 sensitive applications, and vulnerable network services. In order to provide defense-in-
 2438 depth, boundary-control functions should also be implemented directly in FCKMS
 2439 devices.

2440
 2441 An FCKMS could be designed to be configurable or dynamic, capable of adapting to
 2442 network threats based on the results of monitoring network performance, communication
 2443 error detection/correction, and network overload. For example, an attempt to flood a
 2444 network with repetitive or nonsense data could cause an FCKMS to not accept a data

2445 packet or connection request. An intentional and intelligent, but unauthorized,
 2446 modification of network packets could result in packets being refused or a shutdown of
 2447 the affected components or even the entire network.
 2448

2449 **FR:8.15** The CKMS design **shall** specify the boundary protection mechanisms employed
 2450 by the CKMS.

2451
 2452 **FR:8.16** The CKMS design **shall** specify:

- 2453 a) The types of firewalls used and the protocols permitted through the firewalls,
 2454 including the source and destination for each type of protocol; and
- 2455 b) The types of intrusion detection and prevention systems used, including their
 2456 logging and security breach reaction capabilities.

2457
 2458 **FR:8.17** The CKMS design **shall** specify the methods used to protect the CKMS devices
 2459 against denial of service.

2460
 2461 **FR:8.18** The CKMS design **shall** specify how each method used protects against the
 2462 denial of service.
 2463

PR:8.20	AC-4 CA-3(1)	A networked Federal CKMS shall support the following network security-control mechanisms unless exempted by its FCKMS service-using organizations: a) Firewalls, b) Filtering routers, c) Virtual private networks (VPNs), d) Intrusion detection systems (IDS), e) Intrusion prevention systems (IPS), and
PR:8.21		A networked Federal CKMS shall install network security-control mechanisms in physically secure facilities.
PR:8.22	AC-3	A networked Federal CKMS shall allow only authorized entities to configure, initiate, activate, and disable network security-control mechanisms.
PR:8.23	IA-3	For Moderate and High impact-level systems, a Federal CKMS shall support the identification and authentication of each FCKMS module and device.
PR:8.24	SC-5	A Federal CKMS shall employ methods that minimize successful denial-of-service attacks and notify the FCKMS management personnel if any such attempted attack is detected.

2464

PA:8.6		For Low impact-level systems, a Federal CKMS should support the identification and authentication of each FCKMS module and device.
---------------	--	---

2465 **8.4 Cryptographic Module Controls**

2466 A cryptographic module is a set of hardware, software and/or firmware that implements
 2467 cryptographic-based security functions (e.g. cryptographic algorithms and key
 2468 establishment schemes). [FIPS 140] specifies requirements on cryptographic modules
 2469 that are used by the Federal government. This Profile requires the use of FIPS 140-
 2470 validated cryptographic modules (see Section 2.10).

2471
 2472 Two primary security issues should be addressed regarding the security of the contents of
 2473 cryptographic modules: the integrity of the security functions and the protection of the
 2474 cryptographic keys and metadata. Since cryptographic keys are present in plaintext form
 2475 for some period of time within the module, physical security measures are necessary to
 2476 protect keys from unauthorized disclosure, modification, and substitution.

2477
 2478 Each [FIPS 140] cryptographic module must be used in accordance with the
 2479 cryptographic module’s security policy. This detailed security policy specifies the rules
 2480 for operating the cryptographic module, including the security rules that were applicable
 2481 to the module and derived from [FIPS 140], and those imposed by the module developer.

2482
 2483 **FR:8.19** The CKMS design **shall** identify the cryptographic modules that it uses and their
 2484 respective security policies, including:

- 2485 a) The embodiment of each module (software, firmware, hardware, or hybrid),
- 2486 b) The mechanisms used to protect the integrity of each module,
- 2487 c) The physical and logical mechanisms used to protect each module’s cryptographic
 2488 keys, and
- 2489 d) The third-party testing and validation that was performed on each module
 2490 (including the security functions) and the protective measures employed by each
 2491 module.

PR:8.25		A Federal CKMS shall use cryptographic modules in accordance with the security policy of that module.
----------------	--	--

2493 **8.5 Federal CKMS Security-Controls Selection and Assessment Process**

2494 Federal CKMS security controls should be selected, implemented, and used in a manner
 2495 that protects the FCKMS modules and cryptographic keys and metadata in accordance
 2496 with [FIPS 199], [FIPS 200], [SP 800-53], and [SP 800-53A].

2497
 2498 The process specified in the following requirements is defined and explained in [FIPS
 2499 199], [FIPS 200], [SP 800-53], and [SP800-53A]. The process will be used in Section 11
 2500 to perform a security assessment.

2501
2502
2503
2504
2505
2506

The results of previous device and subsystem assessments complying with the procedures of this section may be used with the approval of the System Authority without repeating the assessments, provided that the previous assessment was performed within one year of the current assessment date.

PR:8.26		An FCKMS service-using organization shall specify the types of information to be protected by the FCKMS ¹³ .
PR:8.27	RA-2 RA-3	A Federal CKMS shall comply with [FIPS 199], [FIPS 200], [SP 800-53], and [SP 800-53A] including: <ul style="list-style-type: none"> a) Specifying the [FIPS 199] security categories (SCs) or each type of information to be protected by the FCKMS and the overall security category of the FCKMS; b) Specifying the [FIPS 200] impact level of the FCKMS, based on the [FIPS 199] security category of the FCKMS; c) Supporting the [SP 800-53] security-control overlay in [SP 800-152A] for the FCKMSs, in accordance with the determined impact level; d) For each security control, specifying the assurance requirements that are necessary to achieve the impact level required by the FCKMS; e) Specifying the events that would initiate an assessment of the security of the FCKMS, a reassessment of the current security controls used, and completing all corrective actions required; and f) Assessing the security controls as specified in [SP 800-53A].
PR:8.28	CA-7	An FCKMS shall assess the effectiveness of the FCKMS security controls on an ongoing basis in accordance with the continuous-monitoring guidance provided in [SP 800-53], [SP 800-53A], [SP 800-37], and [SP 800-137].
PR:8.29		Previous device and subsystem assessments that are more than one year old shall not be used.

2507
2508
2509
2510
2511

9 Testing and System Assurances

Prior to the procurement of an FCKMS or FCKMS services, an FCKMS should be subjected to and pass several types of testing to ensure that it 1) conforms to its design and required standards, 2) operates according to its design specifications, 3) rejects service requests that could compromise its security, and 4) is interoperable with peer

¹³ See SP 800-60 for guidance on commonly used information types.

2512 FCKMSs (if required). Various types and levels of testing should be conducted to obtain
 2513 assurance that the FCKMS, including its modules and devices, performs as desired.
 2514

PA:9.1	SA-11	A Federal CKMS should pass procurement and user acceptance testing performed by the FCKMS service-provider and any third-party before procurement of the service.
---------------	-------	--

2515 **9.1 CKMS and FCKMS Testing**

2516 A CKMS, including its modules and devices, should undergo tests by its vendor to verify
 2517 that the CKMS performs according to its design and the CKMS Security Policy.
 2518 Similarly, an FCKMS should undergo tests by the FCKMS service provider to verify that
 2519 the FCKMS performs according to the FCKMS Security Policy. The results of all testing
 2520 should be made available to Federal government officials (perhaps as vendor-proprietary
 2521 information¹⁴) in order to complete the evaluation processes.
 2522

2523 **FR:9.1** A CKMS design **shall** specify the non-proprietary vendor testing that was
 2524 performed on the system and passed.
 2525

PR:9.1	SA-11	Prior to government acceptance of an FCKMS, the FCKMS service provider shall review all vendor tests that have been performed on the CKMS and its devices.
PR:9.2	SA-11	Prior to government acceptance of an FCKMS, the FCKMS service-using organization shall review all FCKMS service provider tests that have been performed on the FCKMS.

2526 **9.2 Third-Party Testing**

2527 An FCKMS vendor, service provider or service-using organization could initiate third-
 2528 party testing of an FCKMS module or device for conformance to selected standards or to
 2529 obtain specific information about the FCKMS. Third-party testing is intended to provide
 2530 confidence that the designer and implementer did not overlook some flaw in their own
 2531 testing procedures or error in the testing results. For example, the National Institute of
 2532 Standards and Technology has established several programs for validating conformance
 2533 to its cryptographic standards and recommendations, including the Cryptographic Module
 2534 Validation Program (CMVP) and the Cryptographic Algorithm Validation Program
 2535 (CAVP). Non-cryptographic software and hardware could be validated using the
 2536 Common Criteria Standard ([ISO/IEC 15408 Parts 1- 3] by the National Information
 2537 Assurance Partnership (NIAP)). These validations produce a high level of assurance
 2538 regarding specific characteristics of a product or service.
 2539

2540 **FR:9.2** The CKMS design **shall** specify all third-party testing programs that have been
 2541 passed to date by the CKMS or its devices.
 2542

¹⁴ Proprietary test results must be marked appropriately, packaged separately, and handled securely.

PR:9.3	SA-4 SA-11 SC-13	Cryptographic modules to be incorporated into a Federal CKMS shall be validated within NIST’s Cryptographic Module Validation Program (CMVP).
PR:9.4	SA-4 SA-11 SC-13	All NIST- approved cryptographic algorithms used by Federal CKMS cryptographic modules shall pass all the appropriate CAVP tests.

2543

PA:9.2	SA-11	Non-cryptographic software and hardware used within a Federal CKMS should be validated using the Common Criteria Standard ([ISO/IEC 15408 Parts 1- 3], National Information Assurance Partnership (NIAP)).
PA:9.3		All Federal CKMS modules and devices should be tested by a third-party, and the test results should be provided to the appropriate FCKMS procurement authorities for review.

2544 **9.3 Interoperability Testing**

2545 Interoperability testing, in its most general form, merely tests that two or more devices
 2546 can be interconnected and operate with one another. This means that the data exchanged
 2547 between the devices should be in a format that each device can process. Interoperable
 2548 devices may be interconnected to form a system, and interoperable systems may be
 2549 interconnected to form a network. Note that this type of testing does not necessarily test
 2550 the internal functioning of the individual device. If a device performs a unique function,
 2551 interoperability testing may not verify that function.

2552
 2553 **FR:9.3** If a CKMS claims interoperability with another system, then the CKMS design
 2554 **shall** specify the tests that have been performed and passed that verify the claim.

2555
 2556 **FR:9.4** If a CKMS claims interoperability with another system, then the CKMS design
 2557 **shall** specify any configuration settings that are required for interoperability.

2558

PR:9.5		If an FCKMS, FCKMS module, or FCKMS device claims interoperability with a reference implementation, then the FCKMS, FCKMS module or FCKMS device shall be tested and validated against the reference implementation.
---------------	--	---

2559 **9.4 Self-Testing**

2560 An FCKMS module or device could be designed, implemented, and operate correctly
 2561 when first deployed, but then fail some time later. A Federal CKMS must use modules
 2562 and devices that test themselves for functionality, integrity and security.

2563
 2564 **FR:9.5** The CKMS design **shall** specify all self-tests created and implemented by the
 2565 designer and the corresponding CKMS functions whose correct operation they verify.

2566

PR:9.6		A Federal CKMS shall perform initial and periodic self-tests that verify the continued correctness of the system.
PR:9.7	SI-6 SI-7	For Moderate and High impact-level systems, a Federal CKMS shall verify its software integrity after initial installation, update installation, system power-on, and then daily thereafter.

2567

PA:9.4	SI-6 SI-7	For Low impact-level systems, a Federal CKMS should verify its software integrity after initial installation, update installation, system power-on, and then daily thereafter.
---------------	--------------	---

2568 **9.5 Scalability Testing**

2569 Scalability is a characteristic of a system, network, or process to perform increasing
 2570 amounts of work correctly. Scalability testing involves testing a device or system to learn
 2571 how it reacts when the number of transactions to be processed or participants to be
 2572 serviced properly during a given period of time increases dramatically. Scalability testing
 2573 can be used to stress devices and systems so that overload problems are detected and
 2574 mitigated before encountering these problems during operational use.

2575

2576 **FR:9.6** The CKMS design **shall** specify all scalability analysis and testing performed on
 2577 the system to date.

2578

PR:9.8		A Federal CKMS shall be subjected to scalability tests, and the results of such testing provided to a Federal procurement authority for review prior to the acquisition of an FCKMS.
---------------	--	---

2579 **9.6 Functional and Security Testing**

2580 Functional testing is used to verify that an implementation performs correctly. For
 2581 example, a functional test could verify that an implemented encryption algorithm
 2582 produces the correct ciphertext.

2583

2584 Security testing is used to verify that an implementation operates securely. For example,
 2585 a security test could verify that, even though a cryptographic algorithm implementation
 2586 produces the correct results, fluctuations in power consumption or other outside
 2587 influences that could affect cryptographic processes do not compromise the key. Thus, a
 2588 cryptographic algorithm implementation could pass functional testing, but fail security
 2589 testing.

2590

2591 Penetration testing is a specific type of security testing in which a team of testing experts
 2592 attacks one or more of a system's computers or devices to defeat its security. Prior to
 2593 penetration testing, the FCKMS is analyzed for potential vulnerabilities that could be
 2594 exploited by the penetration team. Such vulnerabilities could result from an incomplete
 2595 CKMS design, an improper FCKMS configuration, hardware or software flaws, or
 2596 operational weaknesses in key-management services or technical countermeasures. The

2597 scope of penetration testing should include FCKMS hardware, software, personnel
 2598 procedures, facilities, and environmental services. Any findings of, and conclusions
 2599 reached by, the penetration testing team should be addressed before initial deployment of
 2600 the FCKMS.

2601
 2602 Note that individual FCKMS product/device penetration testing could be conducted as
 2603 part of an FCKMS security assessment (see Section 11).
 2604

2605 **FR:9.7** The CKMS design **shall** specify the functional and security testing that was
 2606 performed on the system and the results of the tests.
 2607

PR:9.9	SA-11	A Federal CKMS shall pass functional and security testing before its initial operation.
PR:9.10	CA-8 SA-11	For High impact-level systems, a Federal FCKMS shall pass penetration testing before initial operation, and before resuming operations after major changes.
PR:9.11		A Federal CKMS shall conduct functional and security testing annually or in accordance with a Service Level Agreement (SLA), and continue operation only if the tests are passed.

2608

PA:9.5	CA-8 SA-11	For Low and Moderate impact-level systems, a Federal FCKMS should pass penetration testing before initial operation, and before resuming operations after major changes.
---------------	---------------	---

2609

PF:9.1		The functional and security testing performed on a Federal CKMS could be automated.
---------------	--	--

2610 **9.7 Environmental Testing**

2611 CKMS designers often assume a particular environment (e.g., temperature range and
 2612 voltage range) in which a proposed CKMS product will operate. The CKMS is then
 2613 designed, built and tested for use within that environment. If the products are used in a
 2614 different environment, secure operation could be lost. A CKMS being considered for
 2615 procurement should be subjected to various environments that would test its capability to
 2616 withstand induced environmental changes that stress its limits. Note that at security level
 2617 4, [FIPS 140] requires environmental failure testing of cryptographic modules.
 2618

2619 **FR:9.8** The CKMS design **shall** specify the environmental conditions in which the
 2620 CKMS is designed to be used.
 2621

2622 **FR:9.9** The CKMS design **shall** specify the conditions that are required for its secure
 2623 operation.

2624
 2625 **FR:9.10** The CKMS design **shall** specify the results of environmental testing that was
 2626 performed on the CKMS devices, including the results of all tests stressing the devices
 2627 beyond the conditions for which they were designed.
 2628

PR:9.12		For Moderate and High impact-level systems, Federal CKMS modules and devices shall undergo and pass environmental testing before becoming operational.
----------------	--	---

2629

PA:9.4		For Low impact-level systems, a Federal CKMS modules and devices should undergo and pass environmental testing before becoming operational.
---------------	--	--

2630 **9.8 Ease-of-Use Testing**

2631 An FCKMS should be easy to use, manage, and maintain. In order to evaluate ease-of-
 2632 use, a panel of people having different expertise and experience typically creates
 2633 evaluation criteria, and selects and monitors user-device-interface ease-of-use evaluation
 2634 tests that are performed by a test group of users.

2635
 2636 An FCKMS could support a demonstration of correct FCKMS usage, and could be
 2637 designed to adapt to a user’s experience and abilities. An FCKMS should automatically
 2638 detect incorrect user input; this requires an expectation of the length, format or range of
 2639 the expected input.
 2640

PA:9.6		Federal CKMS interfaces should be tested and approved for ease-of-use prior to procurement by the service provider or by the service using organization.
---------------	--	---

2641

PF:9.2		A Federal CKMS could support automated demonstrations of its capabilities and ease of operation.
PF:9.3		A Federal CKMS could adapt to a user’s experience and abilities.
PF:9.4		A Federal CKMS could be tested for ease-of-use by a third-party prior to procurement and when any human-to-FCKMS interface changes are made.

2642 **9.9 Development, Delivery, and Maintenance Assurances**

2643 The secure development, delivery, and maintenance of CKMS products can play a
 2644 significant role in the security of the CKMS. The following areas should be considered:

- 2645 a) Configuration Management,

- 2646 b) Secure Delivery,
- 2647 c) Development and Maintenance Environmental Security, and
- 2648 d) Flaw Remediation.

2649 Each of these areas is described in the following subsections.

2650 **9.9.1 Configuration Management**

2651 An FCKMS should incorporate products that are developed and maintained under an
 2652 appropriate configuration management system in order to ensure that security is not
 2653 reduced, and functional flaws are not introduced due to unauthorized or unintentional
 2654 changes to the products.

2655 **FR:9.11** The CKMS design **shall** specify:

- 2657 a) The devices (including their source code, documentation, build scripts, executable
 2658 code, firmware, hardware design specification, documentation, and test code) to
 2659 be kept under configuration control.
- 2660 b) The protection requirements (e.g., formal authorizations and proper record
 2661 keeping) to ensure that only authorized changes are made to the components and
 2662 devices under configuration control.

2663

PR:9.13	CM-2 CM-3 CM-9 SA-10	A Federal CKMS shall be under configuration management during design, implementation, procurement, installation, configuration, operation, maintenance, and final destruction.
PR:9.14		The Federal CKMS configuration management system shall maintain records of the make, model, version, and identification number of each FCKMS module and device.

2664

PF:9.5	CM-2 CM-3 CM-9	A Federal CKMS could use automated configuration management control of its FCKMS modules, devices, and operational status throughout its lifetime.
---------------	----------------------	---

2665 **9.9.2 Secure Delivery**

2666 When the computers, software, modules, and devices that are to be used in an FCKMS
 2667 are delivered, assurance of secure delivery (i.e. that the products received are the exact
 2668 products that were ordered) is required.

2669

2670 **FR:9.12** The CKMS design **shall** specify secure delivery requirements for the products
 2671 used in the CKMS, including:

- 2672 a) Protection requirements to ensure that the product has not been tampered with
 2673 during the delivery process or that tampering is detected,

- 2674 b) Protection requirements to ensure that the product has not been replaced during
- 2675 the delivery process or that replacement is detected,
- 2676 c) Protection requirements to ensure that an unrequested delivery is detected, and
- 2677 d) Protection requirements to ensure that the product delivery is not suppressed or
- 2678 delayed and that suppression or delay is detected.

PR:9.15	SA-12 (+10)	A Federal CKMS shall verify that: <ul style="list-style-type: none"> a) The delivered product has not been tampered with during the delivery process, b) The product has not been replaced during the delivery process, c) The delivery of unrequested items is refused, and d) Product delivery is not suppressed or delayed.
PR:9.16	SA-12	A Federal CKMS shall support the notification of FCKMS management personnel when: <ul style="list-style-type: none"> a) Any modification or replacement of the expected delivery item is detected, and b) Any delay or cancellation of product delivery is detected.

2679 **9.9.3 Development and Maintenance Environmental Security**

2680 The CKMS development and FCKMS maintenance environments must be protected
 2681 against physical, technical, and personnel threats. Tools such as compilers, software
 2682 loaders, and text editors should not be automatically trusted.

2684 **FR:9.13** The CKMS design **shall** specify the security requirements for the development
 2685 and maintenance environments of the CKMS, including:

- 2686 a) Physical security requirements,
- 2687 b) Personnel security requirements, such as clearances and background checks for
- 2688 developers, testers, and maintainers,
- 2689 c) Procedural security, such as multiparty control and separation of duties,
- 2690 d) Computer security controls to protect the development and maintenance
- 2691 environment and to provide access control to permit authorized user access,
- 2692 e) Network security controls to protect the development and maintenance
- 2693 environment from hacking attempts,
- 2694 f) Cryptographic security control to protect the integrity of software and its control
- 2695 data under development, and
- 2696 g) The means used to ensure that the tools (e.g., editors, compiler, software linkers,
- 2697 loaders, etc.) are trustworthy and are not sources of malware.

2698

PR:9.17		A Federal CKMS service-providing organization shall verify that the CKMS designer, developer, and implementer followed the claimed procedures for the development and maintenance environment documented in FR:9.13 .
PR:9.18	MA-1 SA-18	A Federal CKMS shall protect against physical, technical, and personnel threats during FCKMS maintenance activities.

2699 **9.9.4 Flaw Remediation Capabilities**

2700 The detection, reporting, and correction of FCKMS flaws must be done in an expeditious
 2701 and secure manner. Users should report potential and detected flaws to the FCKMS
 2702 management. An FCKMS that employs automated flaw-detection techniques is highly
 2703 desirable because it can continuously monitor its own security status, report potential
 2704 problems to an authorized person fulfilling an appropriate FCKMS role, and minimize
 2705 reliance on human monitoring of events that occur infrequently.

2706
 2707 **FR:9.14** The CKMS design **shall** specify the CKMS capabilities for detecting system
 2708 flaws, including:

- 2709 a) Known-answer tests,
- 2710 b) Error detection codes,
- 2711 c) Anomaly diagnostics, and
- 2712 d) Functional Testing.

2713
 2714 **FR:9.15** The CKMS design **shall** specify the CKMS capability for reporting flaws,
 2715 including: the capability to produce status report messages with confidentiality, integrity
 2716 and source authentication protections, and to detect unauthorized delays.

2717
 2718 **FR:9.16** The CKMS design **shall** specify the CKMS capability for analyzing flaws and
 2719 creating/obtaining fixes for likely or commonly known flaws.

2720
 2721 **FR:9.17** The CKMS design **shall** specify its capability to transmit fixes with
 2722 confidentiality, integrity and source authentication protections and to detect unauthorized
 2723 delays.

2724
 2725 **FR:9.18** The CKMS design **shall** specify its capability for implementing fixes in a timely
 2726 manner.

2727

PR:9.19	SA-11 SI-2	A Federal CKMS shall support the detection, reporting, and timely correction of security-compromising flaws by supporting one or more methods for: <ul style="list-style-type: none"> a) Users to report flaws to the FCKMS management, b) Confidentiality and integrity protection of the flaw report, c) Submitting the flaw report to the CKMS designer, and
----------------	---------------	---

		d) Determining the appropriate action to be taken about FCKMS information affected by the flaw.
--	--	---

2728

PF:9.6		A Federal CKMS could support automated flaw-detection and reporting of potential security problems to FCKMS management personnel.
---------------	--	--

2729

2730 **10 Disaster Recovery**

2731 An FCKMS failure could hamper or prevent access to an organization’s information. For
 2732 example, the inability to decipher information because the key is destroyed will prevent
 2733 access to the plaintext data because the information cannot be decrypted. This section
 2734 describes how operational continuity can be achieved in the event of component failures
 2735 or the corruption of keys and metadata.

2736
 2737 Disaster recovery requires having procedures and sufficient backup capability to recover
 2738 from facility damage, utility service outages, communication and computation outages,
 2739 hardware and software failures, and other failures that result in the corruption of keys and
 2740 metadata.

2741
 2742 Several of the PRs and PAs in this section include a specific time frame for recovery.
 2743 Alternatively, recovery could be in accordance with a Service Level Agreement (SLA)
 2744 between a service provider and a service-using organization; the SLA is a service
 2745 contract where the service is formally defined. The specific times provided in the PRs
 2746 and PAs can be used to determine whether recovery times specified in the SLA are
 2747 reasonable for the FCKMS and its associated applications. Note that the required
 2748 recovery times may not be the same for all applications, so the time frames provided in
 2749 an SLA can be customized.

2750

PR:10.1	CP-6 CP-9 (6)	A Federal CKMS shall be installed and operated with sufficient backup capability to ensure operational continuity.
----------------	------------------	---

2751

PA:10.1	CP-2 (3, 4)	A Federal CKMS should have procedures and sufficient backup capability to recover to a secure state following a detected failure within 24 hours or a time period specified in a Service Level Agreement (SLA).
----------------	-------------	--

2752

PF:10.1	CP-2 (3, 4)	A Federal CKMS could have procedures and sufficient backup capability to recover to a secure state within one hour following a detected failure.
----------------	-------------	---

2753 **10.1 Facility Damage**

2754 FCKMS components should be located in physically secure and environmentally
 2755 protected facilities. Facilities may be either fixed or mobile.

2756
 2757 For an FCKMS module in a fixed facility, wind, water and fire damage are common
 2758 risks. For mobile facilities, risks also include physical damage, accidental loss, theft,
 2759 destruction, and a higher probability of use by unauthorized entities than is the case for a
 2760 fixed facility. For mobile devices that contain FCKMS capabilities, the enclosure is
 2761 considered to be the facility (see Section 8.1) and should have physical protection against
 2762 unauthorized access to the device’s electronics. Mobile devices could be provided with
 2763 waterproof containers and owner-identity verification (e.g., fingerprint scanner and
 2764 verifier). However, low-cost mobile devices often do not have the built-in tamper
 2765 protection features of a fixed device. Therefore, the owner who carries and uses a secure
 2766 mobile device is responsible for protecting it against physical damage, loss, and
 2767 unauthorized use. Mobile devices have the advantage that they may be easily replaced.

2768
 2769 Whether an FCKMS is operated in a fixed or mobile facility, a backup facility or
 2770 capability should be provided, and the FCKMS should support reporting and recovery
 2771 procedures in the event of damage to a primary FCKMS facility. FCKMS facilities
 2772 should be designed, implemented, and operated in a manner commensurate with the value
 2773 and sensitivity of the information being protected.

2774
 2775 When a facility is damaged, secret and private keys and keys associated with sensitive
 2776 metadata that could have been disclosed should be immediately placed on Compromised
 2777 Key Lists or Certificate Revocation Lists and replaced. A mobile FCKMS device should
 2778 have the capability of being deactivated remotely by the FCKMS management, and the
 2779 sensitive keys and metadata within the device should be destroyed.

2780
 2781 **FR:10.1**The CKMS design **shall** specify the required environmental, fire, and physical
 2782 access control protection mechanisms and procedures for recovery from damage to the
 2783 primary and all backup facilities.

2784

PR:10.2	PE-2 PE-3 PE-5 PE-6 PE-8 PE-13 PE-14 PE-15 PE-16 PE-18 PE-19	For High impact-level systems, the components of a Federal CKMS shall be located in physically secure and environmentally protected facilities.
----------------	--	--

PR:10.3	CP-2 CP-6 CP-7 CP-9 (+3, 6)	For Moderate and High impact-level systems, the fixed facilities of a Federal CKMS shall have backup facilities and capabilities so that the FCKMS can resume normal operations within twelve hours of a failure of the primary facility or in accordance with a Service Level Agreement.
PR:10.4	CP-2 CP-8 CP-10	A Federal CKMS shall support recovery procedures in the event of the damage or loss of an FCKMS capability.
PR:10.5	PE-3	A Federal CKMS shall be operated in facilities that provide levels of protection and availability that are commensurate with the impact level associated with the information being protected.
PR:10.6		When a primary facility is damaged, and a backup facility is available, a Federal CKMS shall activate its backup facility and place keys that have been, or could have been, compromised on Compromised Key or Certificate Revocation Lists and replace those keys, if required for operational continuity.
PR:10.7		A Federal CKMS shall be tested annually or in accordance with a Service Level Agreement to determine that facility-damage detection and recovery mechanisms and procedures work as required.
PR:10.8		The procedures for maintaining and testing the environmental, physical, and disaster recovery capabilities of a Federal CKMS shall be evaluated every five years or in accordance with a Service Level Agreement and upgraded as needed.
PR:10.9		Damaged or lost FCKMS devices shall be reported to FCKMS management personnel.

2785

PA:10.2	PE-2 PE-3 PE-5 PE-6 PE-8 PE-13 PE-14 PE-15 PE-16 PE-18 PE-19	For Low and Moderate impact-level systems, the components of a Federal CKMS should be located in physically secure and environmentally protected facilities.
----------------	--	---

PA:10.3	PE-3 SA-18 SC-7 SC-28	The mobile devices of a Federal CKMS should have physical protection against unauthorized access to the device’s electronics.
PA:10.4	AC-17 (9) SC-7	A Federal CKMS should have the capability of remotely deactivating mobile FCKMS devices and destroying sensitive keys and metadata within those devices.
PA:10.5		A Federal CKMS component in a fixed facility should be tested every six months or in accordance with a Service Level Agreement to verify that adequate environmental, fire, and physical protection is available.
PA:10.6	CP-2 CP-6 CP-7 CP-9 (+3, 6)	For Low impact-level systems, the fixed facilities of a Federal CKMS should have backup facilities and capabilities so that the FCKMS can resume normal operations within twelve hours of a failure of the primary facility or in accordance with a Service Level Agreement.
PA:10.7		A Federal CKMS should report missing or unintentionally destroyed keys and metadata in primary and backup facilities to the FCKMS cryptographic officer.
PA:10.8		A Federal CKMS mobile facility should have one or more backup facilities available to replace the facility in the event of loss or destruction.

2786

PF:10.2		A Federal CKMS could have one or more archive facilities for long-term storage of keys and metadata.
----------------	--	---

2787 **10.2 Utility Service Outage**

2788 An FCKMS module in a fixed facility requires reliable utility services (e.g., electrical
 2789 power) for assuring its availability. Other required services could include water, sewer,
 2790 air conditioning, heat, and clean air. Adequate utility services in all primary and backup
 2791 fixed facilities must be available to support all electronic devices, human safety and
 2792 comfort during normal operations and emergencies, and should be provided to all
 2793 primary and backup facilities.

2794
 2795 Mobile devices with FCKMS capabilities may require backup batteries and battery
 2796 chargers.

2797
 2798 Backup systems should have utility services that are independent from those of the
 2799 primary system. For example, a surge from a power-line lightning strike could cause
 2800 both the primary system and its backup to fail if they are both served by the same power
 2801 line.

2802

2803 **FR:10.2** The CKMS design **shall** specify the minimum, as well as recommended
 2804 electrical, water, sanitary, heating, cooling, and air filtering requirements for the primary
 2805 and all backup facilities.
 2806

PR:10.10	PE-9 (1) PE-11 PE-12	A Federal CKMS shall be provided with sufficient utility services to support all primary and backup fixed facilities during both normal operation and emergencies.
PR:10.11		A Federal CKMS shall conform to applicable Federal and industry standards for utility assurance and satisfy the CKMS design requirements for utility services for all primary, backup, and archive facilities.

2807 **10.3 Communication and Computation Outage**

2808 An FCKMS needs sufficient communication and computation capability to perform its
 2809 required functions and to provide the key-management services that are required by its
 2810 users. Backup communication and computation capabilities should be provided by an
 2811 FCKMS in the event of system failure. The ability to access alternative communication
 2812 services is highly desirable in the event of a communication-service failure.
 2813

2814 **FR:10.3** The CKMS design **shall** specify the communications and computation
 2815 redundancy present in the design and required to be available during operation in order to
 2816 assure continued operation of services commensurate with the anticipated needs of users,
 2817 enterprises, and CKMS applications.
 2818

PR:10.12	CP-2 CP-8 (3) CP-9 (6) CP-11	When high reliability and availability of the FCKMS services is required, a Federal CKMS shall have backup communications, computation, and electrical services available that can be activated as needed.
PR:10.13	CP-2 (+3, 4) CP-7 CP-8 (+1, 2, 3)	A Federal CKMS shall have the computation and communication redundancy needed to recover from computation or communication failures within twelve hours or in a time period specified within a Service-Level Agreement (SLA).
PR:10.14	CP-8 (3)	For High impact-level systems, the utility service for a backup system of a Federal CKMS shall be independent from that of the primary system.

2819

PA:10.9	CP-8 (3)	For Low and Moderate impact-level systems, the utility service for a backup system of a Federal CKMS should be independent from that of the primary system.
----------------	----------	--

2820

PF:10.3	CP-7 (+3, 4)	A Federal CKMS could support automatic switching to backup computation and communication services within fifteen minutes of a detected utility-service outage.
----------------	--------------	---

2821 **10.4 FCKMS Hardware Failure**

2822 Since an FCKMS is critical for the secure operation of the information-management
 2823 system that it supports, it is desirable to minimize the impact of hardware failures of
 2824 FCKMS components and devices. Replacement parts should be available for critical
 2825 components, or complete system redundancy should be available to obtain assurance that
 2826 the operational impact of a hardware failure is minimal, i.e., limited to reduced
 2827 performance and response time. Some backup systems maintain real-time
 2828 synchronization with the primary system. Such systems are capable of immediately
 2829 taking over the responsibilities of the primary system. Other systems synchronize
 2830 periodically and have a catch-up procedure to bring the backup system up to the state that
 2831 the primary system had just before the failure occurred.

2832
 2833 It is essential that backup systems have as much independence from the primary system
 2834 as possible so that a failure to the primary system does not also result in the same failure
 2835 to the backup. Multiple backup systems could be used to provide error-detection
 2836 capabilities.

2837
 2838 Redundant FCKMS devices can be used to provide error-detection and correction
 2839 capabilities. Two FCKMS devices performing the same services can detect discrepancies
 2840 in the results of a key-management function; three systems, all performing the same
 2841 function, can detect a failure in one system and correct a single failure using the results of
 2842 the other two devices, assuming that the results are the same. Since redundancy
 2843 multiplies the cost of providing key management services, FCKMS service-providing
 2844 organizations should attempt to find an optimum trade-off between redundancy and cost.

2845
 2846 **FR:10.4** The CKMS design **shall** specify the strategy for backup and recovery from
 2847 failures of hardware components and devices.

2848

PR:10.15	CP-9 (+2)	A Federal CKMS shall perform initial and periodic tests of backup and recovery capabilities of its critical FCKMS modules and devices.
PR:10.16		A Federal CKMS shall test the backup and recovery of services requiring high availability at least annually or in accordance with a Service Level Agreement.
PR:10.17		A Federal CKMS shall perform tests of security-critical hardware monthly or in accordance with a Service Level Agreement.
PR:10.18		A Federal CKMS shall repair or replace failed critical hardware and be returned to operational status within 24

		hours of a failure or in accordance with a Service Level Agreement.
--	--	---

2849

PF:10.4		A Federal CKMS could repair or replace failed hardware and be returned to operational status within one hour of a failure when high availability is required.
PF:10.5		A Federal CKMS could automatically verify the operational readiness of its backup services.

2850 **10.5 System Software Failure**

2851 Software errors can have security results ranging from minor problems to catastrophic
 2852 failures. Corrupted software must be detected and replaced as soon as possible using
 2853 integrity tests; such tests include the computation of cryptographic error-detection codes
 2854 (e.g., message authentication codes and digital signatures) and other values determined
 2855 by the code itself (i.e., known answers) that are periodically recomputed on the currently
 2856 used software for comparison with the originally computed values to verify that the
 2857 software is still correct. If an error is detected, an error state should be entered, and an
 2858 error report should be sent to the FCKMS management.
 2859

2860 When a primary FCKMS facility is restored from backup, the most recent information
 2861 since the last secure state was backed up could be lost. Full secure-state FCKMS
 2862 backups should be performed on a regular basis, and the latest FCKMS secure state
 2863 should be reloaded into a repaired-and-ready FCKMS component or device upon the
 2864 detection of a software failure.
 2865

2866 **FR:10.5** The CKMS design **shall** specify all techniques provided by the CKMS to verify
 2867 the correctness of the system software.
 2868

2869 **FR:10.6** The CKMS design **shall** specify all techniques provided by the CKMS to detect
 2870 alterations or garbles to the software once it is loaded into memory.
 2871

2872 **FR:10.7** The CKMS design **shall** specify the strategy for backup and recovery from a
 2873 major software failure.
 2874

PR:10.19	SA-4	A Federal CKMS shall use software that has passed integrity tests before becoming operational.
PR:10.20		A Federal CKMS shall perform backups of its software only after the current software passes its integrity tests.
PR:10.21		A Federal CKMS shall perform software and critical-data backups daily or in accordance with a Service-Level Agreement.

PR:10.22		A Federal CKMS shall reload its software from the latest FCKMS secure-state backup after a software failure is detected or suspected.
PR:10.23		A Federal CKMS shall perform full secure-state backups at least weekly or in accordance with a Service Level Agreement.
PR:10.24		A Federal CKMS shall ensure that all software errors are analyzed and repaired before the system is returned to a secure state.

2875

PF:10.6		A Federal CKMS could automatically verify correct operation of the FCKMS software and hardware by randomly performing supported key-management functions simultaneously in the primary and backup facilities and verifying that the results are identical.
----------------	--	---

2876 **10.6 Cryptographic Module Failure**

2877 Cryptographic modules should have built-in tests that are adequate to detect hardware,
 2878 software, or firmware failures. [FIPS-140]-validated modules perform pre-operational,
 2879 conditional, and periodic self-tests. If a failure is detected, the module enters an error
 2880 state that outputs an error indicator and determines if the error is a non-recoverable type
 2881 (i.e. one that requires service, repair, or replacement) or a recoverable type (i.e., one that
 2882 requires initialization or resetting). If the error is recoverable, the module should be
 2883 rebooted and pass all power-up self-tests before performing normal processing. If the
 2884 error recurs after repeated attempts to reboot, then the module should be replaced.

2885
 2886 **FR:10.8** The CKMS design **shall** specify what self-tests are used by each cryptographic
 2887 module to detect errors and verify the integrity of the module.

2888
 2889 **FR:10.9** The CKMS design **shall** specify how each cryptographic module responds to
 2890 detected errors.

2891
 2892 **FR:10.10** The CKMS design **shall** specify its strategy for the repair or replacement of
 2893 failed cryptographic modules.

2894

PF:10.7		A Federal CKMS could automatically switch FCKMS processing to a backup cryptographic module upon detection or suspicion of a cryptographic module failure.
----------------	--	---

2895 **10.7 Corruption of Keys and Metadata**

2896 Cryptographic keys and metadata can be corrupted during transmission or in storage. If a
 2897 corrupted key, or a key with corrupted metadata, has been used to protect data, the
 2898 security consequences should be evaluated, since a loss or compromise of sensitive data

2899 could result. Corrupted keys and metadata should be either replaced or recovered from
 2900 reliable storage (e.g., backup) as soon as the corruption is detected.

2901
 2902 **FR:10.11** The CKMS design **shall** specify its procedures for backing-up and archiving
 2903 cryptographic keys and their metadata.

2904
 2905 **FR:10.1210.5** The CKMS design **shall** specify its procedures for restoring or replacing
 2906 corrupted keys and metadata that have been stored or transmitted.

2907

PR:10.25		A Federal CKMS shall support: a) Periodically checking for corrupted keys and metadata, b) Reporting corrupted keys or metadata to the FCKMS management and affected entities, c) Preventing the use of corrupted keys and/or metadata for applying cryptographic protection, and d) Replacing corrupted keys and metadata.
PR:10.26		A Federal CKMS shall revoke corrupted keys.

2908

PA:10.10		A Federal CKMS should recover or replace corrupted keys and metadata as soon as the corruption is detected or suspected.
PA:10.11		A Federal CKMS should evaluate the potential consequences of having used a corrupted key or metadata.
PA:10.12		A Federal CKMS should automatically report corrupted keys and metadata to the system authority.

2909

PF:10.8		A Federal CKMS could automatically report corrupted keys and metadata to all potentially affected entities, and initiate recovery and replacement procedures.
----------------	--	--

2910 **11 Security Assessment**

2911 Security should be assessed periodically throughout the entire lifetime of a Federal
 2912 CKMS. This section describes assessments that should be made prior to its initial
 2913 operation, during periodic (e.g., annual) reviews, and after major changes. For additional
 2914 information on security assessment practices and controls, see [SP 800-37], [SP 800-53],
 2915 [SP 800-53A], and [SP 800-115].

2916
 2917 A team of experienced people should perform a security assessment with expertise in
 2918 several areas that are selected based on the type of assessment being conducted. A
 2919 security-assessment team should consist of individuals who possess expertise in these
 2920 areas and in the planned security assessment topic.

2921

PA:11.1		<p>A Federal CKMS should be subjected to security assessments by a team of people that collectively have experience and expertise in:</p> <ul style="list-style-type: none"> a) Computer Security, b) Cryptography, c) Cryptographic protocols, d) Distributed system design, e) Functional safety, f) Human usability/accessibility requirements, g) Key Management, h) Network Security, i) Information Security, j) Secure information system laws, regulations and standards, k) Secure system design, and l) Security Assessments.
----------------	--	--

2922 **11.1 Full Security Assessment**

2923 Following installation, but prior to its initial operation, the security of an FCKMS should
 2924 be fully assessed.

2925
 2926 **FR:11.1** The CKMS design **shall** specify the necessary assurance activities to be
 2927 undertaken prior to or in conjunction with a full CKMS security assessment.

2928
 2929 **FR:11.2** The CKMS design **shall** specify the circumstances under which a full security
 2930 assessment is to be repeated.

2931

PR:11.1	<p>CA-1 CA-2 SA-11</p>	<p>A Federal CKMS shall undergo a full security assessment including the following:</p> <ul style="list-style-type: none"> a) A review of the goals of the implemented system, along with a written justification as to how the FCKMS supports the goals; b) An architectural review; c) A review of the results of security tests conducted by third-party testing organizations; d) Functional and security testing; e) Penetration testing (when required); f) An assessment to ensure that the FCKMS supports the FCKMS security policies of its service-using organizations; g) An assessment of the FCKMS security controls as
----------------	--	--

		described and required in Section 8.5; and h) An overall assessment of the security of the FCKMS.
PR:11.2	CA-2	A Federal CKMS shall undergo and pass a full security assessment under the following circumstances: a) Before initial operation, b) After a significant change to any policy affecting the security of the FCKMS, c) After major system changes, and d) Immediately after the occurrence or suspected occurrence of a compromise.

2932

PA:11.2		A Federal CKMS should support all interfaces that are needed for testing by a security-assessment team.
----------------	--	--

2933 **11.1.1 Review of Third-Party Testing and Verification of Test Results**

2934 Even though no formal validation programs for the security of an entire FCKMS
2935 currently exist, certain programs have been established to test parts of the FCKMS,
2936 including:

- 2937 a) NIST’s Cryptographic Algorithm Validation Program (CAVP), which tests NIST-
2938 approved cryptographic algorithms against their specifications,
- 2939 b) NIST’s Cryptographic Module Validation Program (CMVP), which tests
2940 cryptographic modules against the requirements in [FIPS 140], and
- 2941 c) The National Information Assurance Partnership (NIAP), which tests non-
2942 cryptographic software and hardware against the Common Criteria Standard (see
2943 [ISO/IEC 15408 Parts 1- 3]).

2944 Even though these programs do not guarantee security, they can significantly increase
2945 confidence in the security and integrity of an FCKMS.

2947 **FR:11.3** The CKMS design **shall** specify all validation programs under which any of the
2948 CKMS devices have been validated.

2949

2950 **FR:11.4** The CKMS design **shall** specify all validation certificate numbers for its
2951 validated devices.

2952

PR:11.3		During a full security assessment, the assessment team for a Federal CKMS shall verify that NIST-approved cryptographic algorithms are supported in the FCKMS and have been validated under the NIST Cryptographic Algorithm Validation Program (CAVP).
----------------	--	--

PR:11.4		During a full security assessment, the assessment team for a Federal CKMS shall verify that all cryptographic modules used by the FCKMS have been validated for conformance to FIPS 140 under the NIST Cryptographic Module Validation Program (CMVP).
----------------	--	---

2953

PA:11.3		During a full security assessment, the assessment team for a Federal CKMS should verify that non-cryptographic software and hardware (e.g. operating systems, DBMS, or firewalls) used in or by the FCKMS have been validated using the Common Criteria Standard (see [ISO/IEC 15408 Parts 1- 3]) under the National Information Assurance Partnership (NIAP)
PA:11.4		During a full security assessment, the assessment team for a Federal CKMS service-using organization should verify and review the results of all third-party testing.

2954 **11.1.2 Architectural Review of System Design**

2955 An architectural review is an examination of a system’s security architecture by a
 2956 qualified team of experts to determine that the basic design is consistent with its security
 2957 goals. It is required in Section 11.1 for all FCKMS(s).

2958
 2959 **FR:11.5** The CKMS design **shall** specify whether an architectural review is required as
 2960 part of the full security assessment.

2961
 2962 **FR:11.6** If an architectural review is required, then the CKMS design **shall** specify the
 2963 skill set required by the architectural review team.

2964

PR:11.5		During an architectural review, the assessment team for a Federal CKMS shall have access to all CKMS design information, third-party-validation information, and all the results of available FCKMS/CKMS testing.
----------------	--	--

2965

PA:11.5		The architectural review team for a Federal CKMS should recommend penetration-testing scenarios when penetration testing is to be performed.
PA:11.6	SA-4	A Federal CKMS using-organization should analyze the results of the architectural review before procuring an FCKMS.

2966 **11.1.3 Functional and Security Testing**

2967 Functional and security testing of an FCKMS should be performed prior to initial
 2968 deployment, during subsequent periodic security reviews, and during incremental

2969 security assessments. Functional and security tests could be performed by the CKMS
 2970 developer, CKMS implementer, the FCKMS service provider, or a trusted third party.
 2971 These tests could also be performed, or the results reviewed, by an FCKMS-using
 2972 organization.

2973
 2974 Functional testing should include usability tests for users whose knowledge and
 2975 experience with an FCKMS range from novice to expert. An FCKMS is considered to be
 2976 “user-friendly” when it can be easily used by novice users, or when the services are
 2977 automatically provided and controlled by an FCKMS that is “transparent” to the user.
 2978

2979 **FR:11.7** The CKMS design **shall** specify all required functional and security testing of
 2980 the CKMS.

2981
 2982 **FR:11.8** The CKMS design **shall** report the results of all functional and security tests
 2983 performed to date.
 2984

PR:11.6	SA-11	A Federal CKMS shall undergo functional and security testing, including usability tests before initial operation.
----------------	-------	--

2985

PF:11.1		A Federal CKMS could automatically test the security and functionality of all of its services that are intended to support and interact with other security domains and report the results to all participating security domain administrators.
----------------	--	--

2986 **11.1.4 Penetration Testing**

2987 Penetration tests are used to determine the extent to which a system resists active
 2988 attempts to compromise its security. This type of testing requires security experts who are
 2989 knowledgeable about typical system weaknesses and attacks against them, and who can
 2990 create new or unsuspected attack methods. The penetration-testing team for an FCKMS
 2991 should include some individuals who are not part of the CKMS design team and who do
 2992 not have preconceived notions about its security.
 2993

2994 **FR:11.9** The CKMS design **shall** specify the results of any completed penetration testing
 2995 performed to date.
 2996

PR:11.7	CA-8	Penetration testing shall be performed on High impact-level Federal CKMSs.
PR:11.8	CA-8 (+1) SA-11 (5)	When penetration testing is to be performed on a Federal CKMS, the penetration testing team shall include individuals who did not assist in the CKMS design.

2997

PA:11.7		A penetration-testing team should include individuals with experience in computer and communication systems design and testing, software testing, vulnerability analysis, and security threat analysis.
PA:11.8	SA-11 (5)	When penetration testing has been performed on a Federal CKMS, the system should undergo penetration testing at least every two years or in accordance with a Service Level Agreement.

2998 **11.2 Periodic Security Review**

2999 FCKMS system controls, physical controls, procedural controls and personnel controls
 3000 should be reviewed periodically to ensure that these controls are in place and operational.
 3001 Any changes to the FCKMS since the previous security review should be examined to
 3002 ensure that the products/components are operating with the latest updates and security
 3003 patches, and that the products have maintained their third-party security rating. Issues
 3004 identified from the review should be addressed. In addition, periodic functional and
 3005 security testing should be performed (see Section 9.6).

3006
 3007 **FR:11.10** The CKMS design **shall** specify the periodicity of security reviews.

3008
 3009 **FR:11.11** The CKMS design **shall** specify the scope of the security review in terms of
 3010 the CKMS devices.

3011
 3012 **FR:11.12** The CKMS design **shall** specify the scope of the periodic security review in
 3013 terms of the activities undertaken for each CKMS device under review.

3014
 3015 **FR:11.13** The CKMS design **shall** specify the functional and security testing to be
 3016 performed as part of the periodic security review.

3017

PR:11.9	CA-2	The security of a Federal CKMS shall be reviewed annually or in accordance with a Service Level Agreement to assure that it is operating with the latest security updates incorporating all current CKMS implementer-supported software.
----------------	------	---

3018

PF:11.2	CA-7	A Federal CKMS could perform continuous monitoring of its security-critical key management processing and data storage capabilities, modules, and devices.
----------------	------	---

3019 **11.3 Incremental Security Assessment**

3020 An incremental security assessment is limited in scope and should be conducted after any
 3021 change is made to the FCKMS that is not the result of a security compromise. The scope
 3022 of the assessment is limited to the specific change involved and any affects that the

3023 change could have on the FCKMS performance or security. If any system change is the
 3024 result of a security compromise, then a full security assessment as specified in Section
 3025 11.1 should be performed.
 3026

3027 **FR:11.14** The CKMS design **shall** specify the circumstances under which an incremental
 3028 security assessment should be conducted.

3029 **FR:11.15** The CKMS design **shall** specify the scope of incremental security assessments.
 3030
 3031

PR:11.10	CA-2	A Federal CKMS shall undergo an incremental security assessment after any change is made to any part of the FCKMS that is not the result of a security compromise.
PR:11.11	CA-2	If the change is the result of a security compromise, then a Federal CKMS shall undergo a full security assessment as specified in Section 11.1.
PR:11.12		An incremental security assessment for a Federal CKMS shall include the identification of any changes to the system since the last security assessment, an architectural review of any design changes, and functional and security testing of the FCKMS.
PR:11.13		A Federal CKMS shall support producing a report following an incremental security assessment that includes the following: a) The reasons for any changes; b) Inconsistencies that could have arisen between the CKMS design, the FCKMS implementation, and this Profile; c) The results of the assessment, including all discovered security defects; and d) Any corrective actions to be performed and the dates by which the actions must be completed.

3032

PF:11.3		A Federal CKMS could automatically initiate an incremental security assessment after making a change in an existing security policy or when creating a new FCKMS Security Policy that has been negotiated with one or more FCKMSs in other security domains.
----------------	--	---

3033 **11.4 Security Maintenance**

3034 While an FCKMS could be designed, implemented, and operated to provide a specific
 3035 impact level (e.g., Low, Moderate, or High), the protection provided could be reduced if
 3036 configuration changes are made or when new threats are identified. In order to maintain

3037 or enhance the security of an FCKMS, it should be upgraded in accordance with
 3038 hardening guidelines (see Section 8.2.1).

3039
 3040 **FR:11.16** The CKMS design **shall** list the hardening activities required to be performed
 3041 in order to maintain its security.
 3042

PR:11.14	MA-2	Following maintenance activities and before returning to an operational state, the Federal CKMS system administrator shall : a) Verify that the security settings are still acceptable, and b) Perform testing against the hardening guidelines in Section 8.2.1 when changes have been made to the FCKMS.
-----------------	------	---

3043

PA:11.9	CA-2	A Federal CKMS should support the preparation of a security-assessment report that describes: a) The security maintenance that has been performed on the FCKMS since the last report, b) The current risks of the failure of one or more FCKMS components and/or devices, c) The results of the most recent security assessment, and d) The processes followed in implementing all recommendations for upgrading software or devices that were identified as being subject to failure.
PA:11.10	MA-1 MA-2	A Federal CKMS should initiate a security maintenance procedure following notification of an actual or possible security-threatening event.

3044 **12 Technological Challenges**

3045 A CKMS should be designed and implemented to have a security lifetime of many years.
 3046 The CKMS designer, FCKMS service-provider and the FCKMS service-using
 3047 organization should periodically evaluate possible threats resulting from advances in
 3048 technology that may render its key-management services insecure, including¹⁵:
 3049

- 3050 a) New attacks on cryptographic algorithms,
- 3051 b) New attacks on key-establishment protocols,
- 3052 c) New attacks on FCKMS devices, and
- 3053 d) New computing technologies.

3054

¹⁵ See Section 12 of the Framework for detailed descriptions of these threats.

- 3055 **FR:12.1** The CKMS design **shall** specify the expected security lifetime of each
 3056 cryptographic algorithm implemented in the system.
 3057
 3058 **FR:12.2** The CKMS design **shall** specify which sub-functions (e.g., the hash sub-
 3059 function of HMAC) of the cryptographic algorithms can be upgraded or replaced with
 3060 similar, but cryptographically improved, sub-functions without negatively affecting the
 3061 CKMS operation.
 3062
 3063 **FR:12.3** The CKMS design **shall** specify which key establishment protocols are
 3064 implemented by the system.
 3065
 3066 **FR:12.4** The CKMS design **shall** specify the expected security lifetime of each key
 3067 establishment protocol implemented in the system in terms of the expected security
 3068 lifetimes of the cryptographic algorithms employed.
 3069
 3070 **FR:12.5** The CKMS design **shall** specify the extent to which external access to CKMS
 3071 devices is permitted.
 3072
 3073 **FR:12.6** The CKMS design **shall** specify how all allowed external accesses to CKMS
 3074 devices are controlled.
 3075
 3076 **FR:12.7** The CKMS design **shall** specify the features employed to resist or mitigate the
 3077 consequences of the development of new technologies, such as a quantum computing
 3078 attack on the CKMS cryptographic algorithms.
 3079
 3080 **FR:12.8** The CKMS design **shall** specify the currently known consequences of a
 3081 quantum computing attack upon the CKMS cryptography.
 3082

PA:12.1		<p>Throughout the lifetime of a Federal CKMS, the CKMS designer/developer, and the FCKMS service-providing and service-using organizations should evaluate possible threats to the FCKMS resulting from advances in technology that may render the FCKMS insecure, including:</p> <ul style="list-style-type: none"> a) New attacks on cryptographic algorithms, b) New attacks on key-establishment protocols, c) New attacks on FCKMS devices, d) New computing technologies that could reduce the security provided by a cryptographic algorithm, e) New attacks on access control mechanisms, and f) New mathematical attacks that could reduce the protection provided by a cryptographic algorithm and a fixed key length.
----------------	--	---

3083

PF:12.1		Federal CKMS administrators could review the current FCKMS technology used in security-domain policy specification, negotiation, and/or enforcement to determine if an upgrade or replacement of the FCKMS is needed.

3197 **Appendix B: Glossary**

3198 This glossary defines terms that are used in this Profile, some of which may also be
 3199 defined in the Framework.

3200

Access control system	A set of procedures and/or processes, normally automated, that allows access to a controlled area or to information to be controlled in accordance with pre-established policies and rules.
Active state	A lifecycle state for a key in which the key may be used to cryptographically protect information (e.g., encrypt plaintext or generate a digital signature), to cryptographically process previously protected information (e.g., decrypt ciphertext or verify a digital signature) or both.
Archive	Noun: See Archive facility. Verb: To place a cryptographic key and/or metadata into long-term storage that will be maintained even if the storage technology changes.
Archive facility	A facility used for long-term key and/or metadata storage.
Audit log	A record providing documentary evidence of specific events.
Audit Administrator	An FCKMS role that is responsible for establishing and reviewing an audit log, assuring that the log is reviewed periodically and after any security-compromise-relevant event, and providing audit reports to FCKMS managers.
Auditor	See Audit administrator.
Authorization	The process of verifying that a requested action or service is approved for a specific entity.
Availability	Timely, reliable access to information or a service.
Backup facility	A redundant system or service that is kept available for use in case of a failure of a primary facility.
Backup (key and/or metadata)	To copy a key and/or metadata to a medium that is separate from that used for operational storage and from which the key and/or metadata can be recovered if the original values in operational storage are lost or modified.
Backup (system)	The process of copying information or processing status to a redundant system, service, component or medium that can provide the needed processing capability when needed.

Certification path	A chain of trusted public-key certificates that begins with a certificate whose signature can be verified by a relying party using a trust anchor, and ends with the certificate of the entity whose trust needs to be established.
Ciphertext	Data in its encrypted form.
CKMS	A Cryptographic Key Management System that conforms to the requirements of [SP 800-130].
CKMS design	The capabilities that were selected and specified by a CKMS designer to be implemented and supported in a CKMS product.
CKMS designer	The entity that selects the capabilities to be included in a CKMS, documents the design in accordance with the requirements specified in [SP 800-130], and specifies a CKMS Security Policy that defines the rules that are to be enforced in the CKMS.
CKMS developer	The entity that assembles a CKMS as designed by the CKMS designer.
CKMS implementer	The entity that installs the CKMS for the FCKMS service provider.
CKMS module	A device that performs a set of key and metadata management functions for at least one CKMS.
CKMS Security Policy	A security policy specific to a CKMS
CKMS product	An implementation of a CKMS design produced by a vendor that conforms to the requirements of [SP 800-130], provides a set of key management services and cryptographic functions, and operates in accordance with the CKMS designer's CKMS Security Policy.
CKMS vendor	The entity that markets the CKMS to CKMS service providers.
Compatible security domains	Two Security Domains are compatible if they can exchange a key and its metadata without violating (or altering) either domain's FCKMS security policy.
Compromise (noun)	The unauthorized disclosure, modification, substitution, or use of sensitive data (e.g., keys, metadata, or other security-related information) or the unauthorized modification of a security-related system, device or process in order to gain unauthorized access.

Compromise (verb)	To reduce the trust associated with a key, its metadata, a system, device or process.
Compromise recovery	The procedures and processes of restoring a system, device or process that has been compromised back to a secure or trusted state, including destroying compromised keys, replacing compromised keys (as needed), and verifying the secure state of the recovered system.
Compromised state	A lifecycle state for a key that is known or suspected of being known by an unauthorized entity.
Computer Security Policy	The high-level policy for the security services that are to be supported by a computer for protecting its applications, stored data, and communications, and the rules to be followed in verifying user identities and authorizing their requests before they are granted.
Confidentiality	The property that sensitive information is not disclosed to unauthorized entities.
Configurable	A characteristic of a system, component, or software that allows it to be changed by an entity authorized to select or reject specific capabilities to be included in an operational, configured version.
COTS product	A product that is commercially available.
Cryptographic algorithm	A well-defined computational procedure that takes variable inputs, often including a cryptographic key, and produces an output.
Cryptographic module	The set of hardware, software, and/or firmware that implements security functions (including cryptographic algorithms), holds plaintext keys and uses them for performing cryptographic operations, and is contained within a cryptographic module boundary. This Profile requires the use of a validated cryptographic module as specified in [FIPS 140].
Cryptographic module (compromised)	A cryptographic module whose keys and/or metadata have been subjected to unauthorized access, modification, or disclosure while contained within the cryptographic module.
Cryptographic Module Security Policy	A specification of the security rules under which a cryptographic module is designed to operate.
Cryptographic officer	An FCKMS role that is responsible for and authorized to initialize and manage all cryptographic services, functions, and keys of the FCKMS.

Cryptographic operation	The execution of a cryptographic algorithm. Cryptographic operations are performed in cryptographic modules.
Cryptoperiod	The time span during which a specific key is authorized for use or in which the keys for a given system or application may remain in effect.
Deactivated state	A lifecycle state of a key whereby the key is no longer to be used for applying cryptographic protection. Processing already protected information may still be performed.
Destroyed state	A lifecycle state of a key whereby the key is no longer available and cannot be reconstructed.
Digital signature	The result of a cryptographic transformation of data that, when properly implemented with a supporting infrastructure and policy, provides the services of: <ol style="list-style-type: none"> 1. Origin authentication, 2. Data integrity, and 3. Signer non-repudiation.
Domain authority	An FCKMS role that is responsible for accepting another domain's FCKMS Security Policy as equivalent or compatible to its own. The FCKMS system authority often performs this role.
Downgrading	An authorized reduction in the level of protection to be provided to specified information, e.g., from a Moderate impact level down to a Low impact level.
Ease-of-use	A metric of satisfaction in using a product as established by one or more individuals using the product.
Entity	An individual (person), organization, device, or process.
Entity authentication	A process that provides assurance of an entity's identity.
Environmental testing	Evaluating the behavior of a device or system to obtain assurance that it will not be compromised by environmental conditions or fluctuations when operating outside the normal operating range.
Equivalent security domains	Two or more security domains that have FCKMS security policies that have been determined to provide equivalent protection for the information.
Error-detection code	A code computed from data and comprised of redundant bits of information that have been designed to detect unintentional changes in the data.

Facility (mobile device)	One or more CKMS devices contained within a physically protected enclosure that is portable (e.g., a mobile phone or a laptop computer). The user of the mobile facility may be required to guard and protect the contents of the facility itself.
Facility (static device)	One or more CKMS devices contained within a physically protected enclosure. A facility for a static device is typically a room or building (including their contents) with locks, alarms, and/or guards.
FCKMS	A CKMS that conforms to the requirements of [SP 800-152].
FCKMS (compromised)	An FCKMS whose data have been subjected to unauthorized access, modification, or disclosure while contained within the FCKMS.
FCKMS architecture	The structure of an operational FCKMS, including descriptions and diagrams of the types and locations of all its facilities, FCKMS modules, devices, support utilities, and communications.
FCKMS documentation	The documentation collected or produced by the FCKMS service-providing organization (including the design documentation of the CKMS that will be the foundation of the FCKMS) that states what services and functions are to be provided to FCKMS service-using organizations.
FCKMS module	A device that performs a set of key and metadata management functions for at least one FCKMS.
FCKMS personnel	The individuals of an FCKMS service-providing organization that are authorized to assume the supported roles of the FCKMS.
FCKMS Security Domain	A collection of entities that share a common FCKMS Security Policy
FCKMS Security Policy	A security policy specific to an FCKMS.
FCKMS service provider (FCKMS service-providing organization)	An entity that provides FCKMS key management services to one or more FCKMS service-using organizations in accordance with their respective FCKMS Security Policies.
FCKMS service user (FCKMS service-using organization)	A Federal organization or contractor that has selected an FCKMS service provider to provide key management services.

FCKMS Security Policy	The security policy defined by a FCKMS service provider and the FCKMS service user that specifies how the FCKMS will be operated.
FIPS 140 security level	A metric of the security provided by a cryptographic module that is specified as Level 1, 2, 3, or 4, as specified in [FIPS 140], where Level 1 is the lowest level, and Level 4 is the highest level.
Firewall	A part of a computer system or network that is designed to block unauthorized access while permitting outward communication.
Framework (for CKMS)	The CKMS requirements specified in [SP 800-130].
Functional testing	Testing that verifies that an implementation of some function operates correctly.
Hardening	A process intended to eliminate a means of attack by patching vulnerabilities and turning off nonessential services.
Hash function	An algorithm that computes a numerical value (called the hash value) on a data file or electronic message that is used to represent that file or message, and depends on the entire contents of the file or message. A hash function can be considered to be a fingerprint of the file or message.
Identity authentication	See Entity authentication.
Impact level	Refers to the three broadly defined impact levels in [FIPS 200] that categorize the impact of a security breach as Low, Moderate or High.
Incremental testing	Testing a system or device to determine that changes have not affected its security and intended functionality.
Information Management Policy	The high-level policy of an organization that specifies what information is to be collected or created, and how it is to be managed.
Information Security Policy	A high-level policy of an organization that is created to support and enforce portions of the organization's Information Management Policy by specifying in more detail what information is to be protected from anticipated threats and how that protection is to be attained.
Integrity	A property whereby data has not been altered in an unauthorized manner since it was created, transmitted, or stored.

Integrity protection	A physical or cryptographic means of providing assurance that information has not been altered in an unauthorized manner since it was created, transmitted, or stored.
Integrity verification	Obtaining assurance that information has not been altered in an unauthorized manner since it was created, transmitted or stored.
Key agreement	A key-establishment procedure where the resultant keying material is a function of information contributed by two or more participants, so that no entity can predetermine the resulting value of the keying material independently of any other entity's contribution.
Key confirmation	A procedure to provide assurance to one entity (the key-confirmation recipient) that another entity (the key-confirmation provider) actually possesses the correct secret keying material and/or shared secret.
Key custodian	An FCKMS role that is responsible for distributing keys or key splits and/or entering them into a cryptographic module.
Key derivation	The process of deriving a key in a non-reversible manner from shared information, some of which is secret.
Key distribution	See Key transport.
Key establishment	The process that results in the sharing of a key between two or more entities, either by transporting a key from one entity to another (key transport) or generating a key from information shared by the entities (key agreement).
Key format	The data structure of a cryptographic key.
Key life cycle	The period of time between the creation of the key and its destruction.
Key owner	A person authorized by an FCKMS service provider or service user to use a specific key that is managed by the FCKMS.
Key (plaintext)	A cryptographic key that can be directly used by a cryptographic algorithm to perform a cryptographic operation.
Key splitting	Dividing a key into two or more parts (i.e., key splits), such that the original key cannot be obtained without properly combining a sufficient number of the parts.
Key splitting (k of n)	Dividing a key into n parts, such that the original key cannot be obtained without having at least k of the parts, where $k < n$.

Key states	A categorization of the states that a key can assume during its lifetime. See [SP 800-57 Part 1].
Key transport	A manual or automated key-establishment procedure whereby one entity (the sender) selects and distributes the key to another entity (the receiver).
Key type	One of the twenty-one types of keys listed in [SP 800-130], most of which are defined in [SP 800-57 Part 1].
Key update	A key-derivation process whereby the derived key replaces the key from which it was derived when the key-derivation process is later repeated.
Key wrapping	A method of encrypting keys using a symmetric key that provides both confidentiality and integrity protection.
Key and metadata management functions	Functions performed by a CKMS or FCKMS in order to manage keys and metadata.
Key/metadata recovery	The process of retrieving or reconstructing a key or metadata from backup or archive storage.
Key-recovery agent	An FCKMS role that assists in the key-recovery/metadata-recovery process.
Message Authentication Code (MAC)	A cryptographic checksum on data that uses a symmetric key to detect both accidental and intentional modifications of data.
Malware	Software designed and operated by an adversary to violate the security of a computer (includes spyware, virus programs, root kits, and Trojan horses).
Message authentication	A process that provides assurance of the integrity of messages, documents or stored data.
Metadata (explicit)	Parameters used to describe properties associated with a cryptographic key that are explicitly recorded, managed, and protected by the CKMS.
Metadata (implicit)	Information about a cryptographic key that may be inferred (i.e., by context), but is not explicitly recorded, managed, or protected by the CKMS.
Metadata (bound)	Metadata that has been cryptographically combined with the associated key to produce a MAC or digital signature that can be used to verify that the key and metadata are indeed associated with each other.
Metadata (compromised)	Sensitive metadata that has been disclosed to or modified by an unauthorized entity.

Multi-level security domain	A security domain that supports information protection at more than one impact level.
Operating system	A collection of software that manages computer hardware resources and provides common services for computer programs.
Operational storage	Storage within a cryptographic module where the key can be accessed to perform cryptographic functions.
Operator	An FCKMS role that is authorized to operate an FCKMS (e.g., initiate the FCKMS, monitor performance, and perform backups), as directed by the system administrator.
Parameter	A value that is used to control the operation of a function or that is used by a function to compute one or more outputs.
Penetration testing	Testing that verifies the extent to which a system, device or process resists active attempts to compromise its security.
Personal accountability	A policy that requires that every person who accesses sensitive information be held accountable for his or her actions.
Personnel-security compromise	The accidental or intentional action of any person that reduces the security of the FCKMS and/or compromises any of its keys and sensitive metadata.
Physical-security compromise	The unauthorized access to sensitive data, hardware, and/or software by physical means.
Pre-activated state	A lifecycle state of a key in which the key has been created, but is not yet authorized for use.
Primary facility	An FCKMS facility that houses a primary system.
Primary system	An FCKMS module that is currently active. Contrast with Backup (system).
Private key	A cryptographic key used by a public-key cryptographic algorithm that is uniquely associated with an entity and is not made public.
Profile (for a CKMS)	A document that provides an implementation-independent specification of CKMS security requirements for use by a community of interest (e.g., U.S. Government, banking, health, and aerospace).

Profile (for an FCKMS)	The specifications for Federal CKMSs in SP 800-152, including the requirements for their design, implementation, procurement, installation, configuration, management, operation, and use by Federal organizations and their contractors
Profile augmentations	The properties or characteristics that are recommended, but not required, for FCKMSs.
Profile features	The properties or characteristics that could be used by FCKMSs.
Profile Requirements	The properties or characteristics that shall be exhibited in FCKMSs in order to conform to, or comply with, this Profile.
Public key	A cryptographic key used by a public-key cryptographic algorithm that may be made public.
Registration agent	An FCKMS role that is responsible for registering new entities and perhaps other selected information.
Revoked state	A lifecycle state of a key for which the use of that key has been terminated prior to the end of the key's intended cryptoperiod.
Scalability testing	Testing the ability of a system to handle an increasing amount of work correctly.
Secret key	A cryptographic key used by a secret-key (symmetric) cryptographic algorithm that is not made public.
Security assessment	An evaluation of the security provided by a system, device or process.
Security strength	A number associated with the expected amount of work (that is, the base 2 logarithm of the number of operations) to cryptanalyze a cryptographic algorithm or system.
Security testing	Testing that attempts to verify that an implementation protects data and maintains functionality as intended.
Self testing	Testing within a system, device or process during normal operation to detect misbehavior.
Semantics	The intended meaning of acceptable sentences of a language.
Sentences, formal	The entire set of sentences that can be created or recognized as being valid using the formal syntax specifications of a formal language.

Service Level Agreement (SLA)	A service contract between an FCKMS service provider and an FCKMS service user that defines the level of service to be provided, such as the time to recover from an operational failure or a system compromise.
Source authentication	A process that provides assurance of the source of information.
Store a key or metadata	Placing a key and/or metadata in storage outside of a cryptographic module without retaining the original copy in a cryptographic module.
Support	To be capable of providing a service or perform a function that is required or desired; to agree with a policy or position; to fulfill requirements.
Suspended state	A lifecycle state of a key whereby the use of the key for applying cryptographic protection has been temporarily suspended.
Semantics of a language	The meanings of all the language's acceptable sentences.
Symmetric key	See Secret key.
Syntax	The rules for constructing or recognizing the acceptable sentences of a language.
System administrator	An FCKMS role that is responsible for the personnel, daily operation, training, maintenance, and related management of an FCKMS other than its keys. The system administrator is responsible for initially verifying individual identities, and then establishing appropriate identifiers for all personnel involved in the operation and use of the FCKMS.
System authority	An FCKMS role that is responsible to executive-level management (e.g., the Chief Information Officer) for the overall operation and security of an FCKMS. A system authority manages all operational FCKMS roles.
Third-party testing	Independent testing by an organization that was not involved in the design and implementation of the object being tested (e.g., a system or device) and is not intended as the eventual user of that object.
Trust	A characteristic of an entity that indicates its ability to perform certain functions or services correctly, fairly and impartially, along with assurance that the entity and its identifier are genuine.

3201

Trust anchor	One or more trusted public keys that exist at the base of a tree of trust or as the strongest link in a chain of trust and upon which a Public Key Infrastructure is constructed.
Trusted channel	Trusted and safe communication link that is established between the cryptographic module and a sender or receiver to securely communicate unprotected plaintext critical security parameters, key components and authentication data.
Trusted (secure) operating system	An operating system that manages data to make sure that it can be altered, moved, or viewed only by entities having appropriate and authorized access rights.
Upgrading	An authorized increase in the level of protection to be provided to specified information, e.g., from a Low impact level to a Moderate impact level.
User	An FCKMS role that utilizes the key-management services offered by an FCKMS service provider.
User interface	The physical or logical means by which users interact with a system, device or process.
Validation	The process of determining that an object or process is acceptable according to a pre-defined set of tests and the results of those tests.
